This specification defines an XMPP protocol extension for multi-user text chat, whereby multiple XMPP users can exchange messages in the context of a room or channel, similar to Internet Relay Chat (IRC). In addition to standard chatroom features such as room topics and invitations, the protocol defines a strong room control model, including the ability to kick and ban users, to name room moderators and administrators, to require membership or passwords in order to join the room, etc.

Copyright

This XMPP Extension Protocol is copyright © 1999 - 2010 by the XMPP Standards Foundation (XSF).

Permissions

Permission is hereby granted, free of charge, to any person obtaining a copy of this specification (the "Specification"), to make use of the Specification without restriction, including without limitation the rights to implement the Specification in a software program, deploy the Specification in a network service, and copy, modify, merge, publish, translate, distribute, sublicense, or sell copies of the Specification, and to permit persons to whom the Specification is furnished to do so, subject to the condition that the foregoing copyright notice and this permission notice shall be included in all copies or substantial portions of the Specification. Unless separate permission is granted, modified works that are redistributed shall not contain misleading information regarding the authors, title, number, or publisher of the Specification, and shall not claim endorsement of the modified works by the authors, any organization or project to which the authors belong, or the XMPP Standards Foundation.

Warranty

## NOTE WELL: This Specification is provided on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. ##

Liability

In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall the XMPP Standards Foundation or any author of this Specification be liable for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising from, out of, or in connection with the Specification or the implementation, deployment, or other use of the Specification (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if the XMPP Standards Foundation or such author has been advised of the possibility of such damages.

Conformance

This XMPP Extension Protocol has been contributed in full conformance with the XSF’s Intellectual Property Rights Policy (a copy of which can be found at <http://xmpp.org/extensions/ipr-policy.shtml>) or obtained by writing to XMPP Standards Foundation, 1899 Wynkoop Street, Suite 600, Denver, CO 80202 USA).

1 Introduction

Traditionally, instant messaging is thought to consist of one-to-one chat rather than many-to-many chat, which is called variously "groupchat" or "text conferencing". Groupchat functionality is familiar from systems such as Internet Relay Chat (IRC) and the chatroom functionality offered by popular consumer IM services. The Jabber/XMPP community developed and implemented a basic groupchat protocol as long ago as 1999. That "groupchat 1.0" protocol provided a minimal feature set for chat rooms but was rather limited in scope. This specification (Multi-User Chat or MUC) builds on the older "groupchat 1.0" protocol in a backwards-compatible manner but provides advanced features such as invitations, room moderation and administration, and specialized room types.

2 Scope

This document addresses common requirements related to configuration of, participation in, and administration of individual text-based conference rooms. All of the requirements addressed herein apply at the level of the individual room and are "common" in the sense that they have been widely discussed within the Jabber community or are familiar from existing text-based conference environments (e.g., Internet Relay Chat as defined in RFC 1459 \(^1\) and its successors: RFC 2810 \(^2\), RFC 2811 \(^3\), RFC 2812 \(^4\), RFC 2813 \(^5\)). This document explicitly does not address the following:

- Relationships between rooms (e.g., hierarchies of rooms)
- Management of multi-user chat services (e.g., managing permissions across an entire service or registering a global room nickname); such use cases are specified in Service Administration \(^6\)
- Moderation of individual messages
- Encryption of messages sent through a room
- Advanced features such as attaching files to a room, integrating whiteboards, and using MUC rooms as a way to manage the signalling for multi-user audio or video conferencing (see Multiparty Jingle \(^7\))
- Interaction between MUC deployments and foreign chat systems (e.g., gateways to IRC or to legacy IM systems)

---

---
• Mirroring or replication of rooms among multiple MUC deployments

This limited scope is not meant to disparage such topics, which are of inherent interest; however, it is meant to focus the discussion in this document and to present a comprehensible protocol that can be implemented by client and component developers alike. Future specifications might address the topics mentioned above.

3 Requirements

This document addresses the minimal functionality provided by Jabber-based multi-user chat services that existed in 2002 when development of MUC began. For the sake of backwards-compatibility, this document uses the original "groupchat 1.0" protocol for this baseline functionality, with the result that:

• Each room is identified as <room@service> (e.g., <jdev@conference.jabber.org>), where "room" is the name of the room and "service" is the hostname at which the multi-user chat service is running.

• Each occupant in a room is identified as <room@service/nick>, where "nick" is the room nickname of the occupant as specified on entering the room or subsequently changed during the occupant’s visit.

• A user enters a room (i.e., becomes an occupant) by sending directed presence to <room@service/nick>.

• An occupant can change his or her room nickname and availability status within the room by sending presence information to <room@service/newnick>.

• Messages sent within multi-user chat rooms are of a special type "groupchat" and are addressed to the room itself (room@service), then reflected to all occupants.

• An occupant exits a room by sending presence of type "unavailable" to its current <room@service/nick>.

The additional features and functionality addressed in MUC include the following:

1. native conversation logging (no in-room bot required)
2. enabling users to request membership in a room
3. enabling occupants to view an occupant’s full JID in a non-anonymous room
4. enabling moderators to view an occupant’s full JID in a semi-anonymous room
5. allowing only moderators to change the room subject
6. enabling moderators to kick participants and visitors from the room
7. enabling moderators to grant and revoke voice (i.e., the privilege to speak) in a moderated room, and to manage the voice list
8. enabling admins to grant and revoke moderator privileges, and to manage the moderator list
9. enabling admins to ban users from the room, and to manage the ban list
10. enabling admins to grant and revoke membership privileges, and to manage the member list for a members-only room
11. enabling owners to configure various room parameters (e.g., limiting the number of occupants)
12. enabling owners to specify other owners
13. enabling owners to grant and revoke administrative privileges, and to manage the admin list
14. enabling owners to destroy the room

In addition, this document provides protocol elements for supporting the following room types:

1. public vs. hidden
2. persistent vs. temporary
3. password-protected vs. unsecured
4. members-only vs. open
5. moderated vs. unmoderated
6. non-anonymous vs. semi-anonymous

The extensions needed to implement these requirements are qualified by the 'http://jabber.org/protocol/muc' namespace (and the #owner, #admin, and #user fragments on the main namespace URI).
4 Terminology

4.1 General Terms

Affiliation A long-lived association or connection with a room; the possible affiliations are "owner", "admin", "member", and "outcast" (naturally it is also possible to have no affiliation); affiliation is distinct from role. An affiliation lasts across a user’s visits to a room.

Ban To remove a user from a room such that the user is not allowed to re-enter the room (until and unless the ban has been removed). A banned user has an affiliation of "outcast".

Bare JID The <user@host> by which a user is identified outside the context of any existing session or resource; contrast with Full JID and Room JID.

Full JID The <user@host/resource> by which an online user is identified outside the context of a room; contrast with Bare JID and Room JID.

GC The minimal "groupchat 1.0" protocol developed within the Jabber community in 1999; MUC is backwards-compatible with GC.

History A limited number of message stanzas sent to a new occupant to provide the context of current discussion.

Invitation A special message sent from one user to another asking the recipient to join a room; the invitation can be sent directly (see Direct MUC Invitations XEP-0249: Direct MUC Invitations <http://xmpp.org/extensions/xep-0249.html>.) or mediated through the room (as described under Inviting Another User to a Room).

IRC Internet Relay Chat.

Kick To temporarily remove a participant or visitor from a room; the user is allowed to re-enter the room at any time. A kicked user has a role of "none".

Logging Storage of discussions that occur within a room for public retrieval outside the context of the room.

Member A user who is on the "whitelist" for a members-only room or who is registered with an open room. A member has an affiliation of "member".

Moderator A room role that is usually associated with room admins but that may be granted to non-admins; is allowed to kick users, grant and revoke voice, etc. A moderator has a role of "moderator".

MUC The multi-user chat protocol for text-based conferencing specified in this document.

Occupant Any user who is in a room (this is an "abstract class" and does not correspond to any specific role).
Outcast  A user who has been banned from a room. An outcast has an affiliation of "outcast".

Participant  An occupant who does not have administrative privileges; in a moderated room, a participant is further defined as having voice (in contrast to a visitor). A participant has a role of “participant”.

Private Message  A message sent from one occupant directly to another’s room JID (not to the room itself for broadcasting to all occupants).

Role  A temporary position or privilege level within a room, distinct from a user’s long-lived affiliation with the room; the possible roles are "moderator", "participant", and "visitor" (it is also possible to have no defined role). A role lasts only for the duration of an occupant’s visit to a room.

Room  A virtual space that users figuratively enter in order to participate in real-time, text-based conferencing with other users.

Room Administrator  A user empowered by the room owner to perform administrative functions such as banning users; however, a room administrator is not allowed to change the room configuration or to destroy the room. An admin has an affiliation of "admin".

Room ID  The localpart of a Room JID, which may be opaque and thus lack meaning for human users (see under Business Rules for syntax); contrast with Room Name.

Room JID  The <room@service/nick> by which an occupant is identified within the context of a room; contrast with Bare JID and Full JID.

Room Name  A user-friendly, natural-language name for a room, configured by the room owner and presented in Service Discovery queries; contrast with Room ID.

Room Nickname  The resourcepart of a Room JID (see Business Rules for syntax); this is the "friendly name" by which an occupant is known in the room.

Room Owner  The user who created the room or a user who has been designated by the room creator or owner as someone with owner privileges (if allowed); an owner is allowed to change the room configuration and destroy the room, in addition to all administrative privileges. An owner has an affiliation of "owner".

Room Roster  A client’s representation of the occupants in a room.

Server  An XMPP server that may or may not have associated with it a text-based conferencing service.

Service  A host that offers text-based conferencing capabilities; often but not necessarily a sub-domain of an XMPP server (e.g., conference.jabber.org).

Subject  A temporary discussion topic within a room.

Visit  A user’s "session" in a room, beginning when the user enters the room (i.e., becomes an occupant) and ending when the user exits the room.
Visitor  In a moderated room, an occupant who does not have voice (in contrast to a participant). A visitor has a role of ”visitor”.

Voice  In a moderated room, the privilege to send messages to all occupants.

4.2 Room Types

Fully-Anonymous Room  A room in which the full JIDs or bare JIDs of occupants cannot be discovered by anyone, including room admins and room owners; such rooms are NOT RECOMMENDED or explicitly supported by MUC, but are possible using this protocol if a service implementation offers the appropriate configuration options; contrast with Non-Anonymous Room and Semi-Anonymous Room.

Hidden Room  A room that cannot be found by any user through normal means such as searching and service discovery; antonym: Public Room.

Members-Only Room  A room that a user cannot enter without being on the member list; antonym: Open Room.

Moderated Room  A room in which only those with ”voice” are allowed to send messages to all occupants; antonym: Unmoderated Room.

Non-Anonymous Room  A room in which an occupant’s full JID is exposed to all other occupants, although the occupant can choose any desired room nickname; contrast with Semi-Anonymous Room and Fully-Anonymous Room.

Open Room  A room that anyone is allowed to enter without being on the member list; antonym: Members-Only Room.

Password-Protected Room  A room that a user cannot enter without first providing the correct password; antonym: Unsecured Room.

Persistent Room  A room that is not destroyed if the last occupant exits; antonym: Temporary Room.

Public Room  A room that can be found by any user through normal means such as searching and service discovery; antonym: Hidden Room.

Semi-Anonymous Room  A room in which an occupant’s full JID can be discovered by room admins only; contrast with Fully-Anonymous Room and Non-Anonymous Room.

Temporary Room  A room that is destroyed if the last occupant exits; antonym: Persistent Room.

Unmoderated Room  A room in which any occupant is allowed to send messages to all occupants; antonym: Moderated Room.

Unsecured Room  A room that anyone is allowed to enter without first providing the correct password; antonym: Password-Protected Room.
4.3 Dramatis Personae

Most of the examples in this document use the scenario of the witches’ meeting held in a dark cave at the beginning of Act IV, Scene I of Shakespeare’s Macbeth, represented here as the “coven@chat.shakespeare.lit” chatroom. The characters are as follows:

<table>
<thead>
<tr>
<th>Room Nickname</th>
<th>Full JID</th>
<th>Affiliation</th>
</tr>
</thead>
<tbody>
<tr>
<td>firstwitch</td>
<td><a href="mailto:crone1@shakespeare.lit">crone1@shakespeare.lit</a>/desktop</td>
<td>Owner</td>
</tr>
<tr>
<td>secondwitch</td>
<td><a href="mailto:wiccarocks@shakespeare.lit">wiccarocks@shakespeare.lit</a>/laptop</td>
<td>Admin</td>
</tr>
<tr>
<td>thirdwitch</td>
<td><a href="mailto:hag66@shakespeare.lit">hag66@shakespeare.lit</a>/pda</td>
<td>None</td>
</tr>
</tbody>
</table>

5 Roles, Affiliations, and Privileges

A user might be allowed to perform any number of actions in a room, from joining or sending a message to changing configuration options or destroying the room altogether. We call each permitted action a “privilege”. There are two ways we might structure privileges:

1. Define each privilege atomically and explicitly define each user’s particular privileges; this is flexible but can be confusing to manage.

2. Define bundles of privileges that are generally applicable and assign a user-friendly “shortcut” to each bundle (e.g., “moderator” or “admin”).

MUC takes the second approach.

MUC also defines two different associations: long-lived affiliations and session-specific roles. These two association types are distinct from each other in MUC, since an affiliation lasts across visits, while a role lasts only for the duration of a visit. In addition, there is no one-to-one correspondence between roles and affiliations; for example, someone who is not affiliated with a room may be a (temporary) moderator, and a member may be a participant or a visitor in a moderated room. These concepts are explained more fully below.

5.1 Roles

The following roles are defined:

<table>
<thead>
<tr>
<th>Name</th>
<th>Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moderator</td>
<td>REQUIRED</td>
</tr>
<tr>
<td>None</td>
<td>N/A (the absence of a role)</td>
</tr>
<tr>
<td>Participant</td>
<td>REQUIRED</td>
</tr>
<tr>
<td>Visitor</td>
<td>RECOMMENDED</td>
</tr>
</tbody>
</table>
ROLES, AFFILIATIONS, AND PRIVILEGES

Roles are temporary in that they do not necessarily persist across a user's visits to the room and MAY change during the course of an occupant's visit to the room. An implementation MAY persist roles across visits and SHOULD do so for moderated rooms (since the distinction between visitor and participant is critical to the functioning of a moderated room).

There is no one-to-one mapping between roles and affiliations (e.g., a member could be a participant or a visitor).

A moderator is the most powerful occupant within the context of the room, and can to some extent manage other occupants’ roles in the room. A participant has fewer privileges than a moderator, although he or she always has the right to speak. A visitor is a more restricted role within the context of a moderated room, since visitors are not allowed to send messages to all occupants (depending on room configuration, it is even possible that visitors’ presence will not be broadcast to the room).

Roles are granted, revoked, and maintained based on the occupant’s room nickname or full JID rather than bare JID. The privileges associated with these roles, as well as the actions that trigger changes in roles, are defined below.

Information about roles MUST be sent in all presence stanzas generated or reflected by the room and thus sent to occupants (if the room is configured to broadcast presence for a given role).

5.1.1 Privileges

For the most part, roles exist in a hierarchy. For instance, a participant can do anything a visitor can do, and a moderator can do anything a participant can do. Each role has all the privileges possessed by the next-lowest role, plus additional privileges; these privileges are specified in the following table as defaults (an implementation MAY provide configuration options that override these defaults).

<table>
<thead>
<tr>
<th>Privilege</th>
<th>None</th>
<th>Visitor</th>
<th>Participant</th>
<th>Moderator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Present in Room</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Receive Messages</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Receive Occupant Presence</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Broadcast Presence to All Occupants</td>
<td>No</td>
<td>Yes*</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Change Availability Status</td>
<td>No</td>
<td>Yes*</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Change Room Nickname</td>
<td>No</td>
<td>Yes*</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Send Private Messages</td>
<td>No</td>
<td>Yes*</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Invite Other Users</td>
<td>No</td>
<td>Yes*</td>
<td>Yes*</td>
<td>Yes</td>
</tr>
<tr>
<td>Send Messages to All</td>
<td>No</td>
<td>No**</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Modify Subject</td>
<td>No</td>
<td>No*</td>
<td>Yes*</td>
<td>Yes</td>
</tr>
<tr>
<td>Kick Participants and Visitors</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Grant Voice</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Revoke Voice</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes***</td>
</tr>
</tbody>
</table>
5 ROLES, AFFILIATIONS, AND PRIVILEGES

* Default; configuration settings MAY modify this privilege.
* An implementation MAY grant voice by default to visitors in unmoderated rooms.
** A moderator MUST NOT be able to revoke voice privileges from an admin or owner.

5.1.2 Changing Roles

The ways in which an occupant’s role changes are well-defined. Sometimes the change results from the occupant’s own action (e.g., entering or exiting the room), whereas sometimes the change results from an action taken by a moderator, admin, or owner. If an occupant’s role changes, a MUC service implementation MUST change the occupant’s role to reflect the change and communicate the change to all occupants (if the room is configured to broadcast presence for a given role). Role changes and their triggering actions are specified in the following table.

<table>
<thead>
<tr>
<th></th>
<th>None</th>
<th>Visitor</th>
<th>Participant</th>
<th>Moderator</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>--</td>
<td>Enter moderated room</td>
<td>Enter unmoderated room</td>
<td>Admin or owner enters room</td>
</tr>
<tr>
<td>Visitor</td>
<td>Exit room or be kicked by a moderator</td>
<td>--</td>
<td>Moderator grants voice</td>
<td>Admin or owner grants moderator privileges</td>
</tr>
<tr>
<td>Participant</td>
<td>Exit room or be kicked by a moderator</td>
<td>Moderator revokes voice</td>
<td>--</td>
<td>Admin or owner grants moderator privileges</td>
</tr>
<tr>
<td>Moderator</td>
<td>Exit room or be kicked by an admin or owner</td>
<td>Admin or owner changes role to visitor *</td>
<td>Admin or owner changes role to participant or revokes moderator privileges *</td>
<td>--</td>
</tr>
</tbody>
</table>

* A moderator MUST NOT be able to revoke moderator privileges from an occupant who is equal to or above the moderator in the hierarchy of affiliations.

Note: Certain roles are typically implicit in certain affiliations. For example, an admin or owner is automatically a moderator, so if an occupant is granted an affiliation of admin then the occupant will by that fact be granted a role of moderator; similarly, when an occupant is granted an affiliation of member in a moderated room, the occupant automatically has a role of participant. However, the loss of the admin affiliation does not necessarily mean that the occupant no longer has a role of moderator (since a “mere” occupant can be a moderator). Therefore, the role that is gained when an occupant is granted a certain affiliation is stable, whereas the role that is lost when an occupant loses a certain affiliation is not hardcoded.
and is left up to the implementation. Since a client cannot predict what the role will be after revoking a certain affiliation, if it wants to remove both the admin/owner affiliation and the moderator role at the same time then it must specifically request the role change in addition to the affiliation change by including both the ‘role’ attribute and the ‘affiliation’ attribute.

5.2 Affiliations
The following affiliations are defined:

1. Owner
2. Admin
3. Member
4. Outcast
5. None (the absence of an affiliation)

Support for the owner affiliation is REQUIRED. Support for the admin, member, and outcast affiliations is RECOMMENDED. (The “None” affiliation is the absence of an affiliation.) These affiliations are long-lived in that they persist across a user’s visits to the room and are not affected by happenings in the room. In addition, there is no one-to-one mapping between these affiliations and an occupant’s role within the room. When determining the affiliation of an entity, an implementation SHOULD match JIDs in the following order (these matching rules are the same as those defined for privacy lists in RFC 3921):

1. <user@domain/resource> (only that resource matches)
2. <user@domain> (any resource matches)
3. <domain/resource> (only that resource matches)
4. <domain> (the domain itself matches, as does any user@domain or domain/resource)

If a user without a defined affiliation enters a room, the user’s affiliation is defined as “none”; however, this affiliation does not persist across visits (i.e., a service does not maintain a “none list” across visits).
The member affiliation provides a way for a room owner or admin to specify a “whitelist” of users who are allowed to enter a members-only room. When a member enters a members-only room, his or her affiliation does not change, no matter what his or her role is. The member affiliation also provides a way for users to effectively register with an open room and thus be lastingly associated with that room in some way (one result may be that the user’s nickname is reserved in the room).

An outcast is a user who has been banned from a room and who is not allowed to enter the
room.
Information about affiliations MUST be sent in all presence stanzas generated or reflected by the room and sent to occupants (if the room is configured to broadcast presence for a given role).

5.2.1 Privileges

For the most part, affiliations exist in a hierarchy. For instance, an owner can do anything an admin can do, and an admin can do anything a member can do. Each affiliation has all the privileges possessed by the next-lowest affiliation, plus additional privileges; these privileges are specified in the following table.

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Outcast</th>
<th>None</th>
<th>Member</th>
<th>Admin</th>
<th>Owner</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter Open Room</td>
<td>No</td>
<td>Yes*</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Register with Open Room</td>
<td>No</td>
<td>Yes</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Retrieve Member List</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Enter Members-Only Room</td>
<td>No</td>
<td>No</td>
<td>Yes*</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Ban Members and Unaffiliated Users</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Edit Member List</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Edit Moderator List</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes**</td>
<td>Yes**</td>
</tr>
<tr>
<td>Edit Admin List</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Edit Owner List</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Change Room Configuration</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Destroy Room</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

* As a default, an unaffiliated user enters a moderated room as a visitor, and enters an open room as a participant. A member enters a room as a participant. An admin or owner enters a room as a moderator.
* An admin or owner MUST NOT be able to revoke moderation privileges from another admin or owner.

5.2.2 Changing Affiliations

The ways in which a user’s affiliation changes are well-defined. Sometimes the change results from the user’s own action (e.g., registering as a member of the room), whereas sometimes the change results from an action taken by an admin or owner. If a user’s affiliation changes, a MUC service implementation MUST change the user’s affiliation to reflect the change and communicate that to all occupants (if the room is configured to broadcast presence for a given role). Affiliation changes and their triggering actions are specified in the following table.
<table>
<thead>
<tr>
<th>&gt;</th>
<th>Outcast</th>
<th>None</th>
<th>Member</th>
<th>Admin</th>
<th>Owner</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outcast</td>
<td>--</td>
<td>Admin or owner removes ban</td>
<td>Admin or owner adds user to member list</td>
<td>Owner adds user to admin list</td>
<td>Owner adds user to owner list</td>
</tr>
<tr>
<td>None</td>
<td>Admin or owner applies ban</td>
<td>--</td>
<td>Admin or owner adds user to member list, or user registers as member (if allowed)</td>
<td>Owner adds user to admin list</td>
<td>Owner adds user to owner list</td>
</tr>
<tr>
<td>Member</td>
<td>Admin or owner applies ban</td>
<td>Admin or owner changes affiliation to &quot;none&quot;</td>
<td>--</td>
<td>Owner adds user to admin list</td>
<td>Owner adds user to owner list</td>
</tr>
<tr>
<td>Admin</td>
<td>Owner applies ban</td>
<td>Owner changes affiliation to &quot;none&quot;</td>
<td>Owner changes affiliation to &quot;member&quot;</td>
<td>--</td>
<td>Owner adds user to owner list</td>
</tr>
<tr>
<td>Owner</td>
<td>Owner applies ban</td>
<td>Owner changes affiliation to &quot;none&quot;</td>
<td>Owner changes affiliation to &quot;member&quot;</td>
<td>Owner changes affiliation to &quot;admin&quot;</td>
<td>--</td>
</tr>
</tbody>
</table>

Note: This table only offers a basic description of state changes. There are a lot of cases that may seem more complex. E.g. if <capulet.lit> is in the outcast list <juliet@capulet.lit> may still be given the status of a member by adding her to the member list, while <tybalt@capulet.lit> and others remain outcasts. A table to completely describe all those cases would be rather large and is therefore not included in this document.

6 Entity Use Cases

A MUC implementation MUST support Service Discovery ⁸ ("disco"). Any entity can complete the following disco-related use cases.

6.1 Discovering Component Support for MUC

An entity may wish to discover if a service implements the Multi-User Chat protocol; in order to do so, it sends a service discovery information ("disco#info") query to the component’s JID.

Listing 1: Entity Queries Chat Service for MUC Support via Disco

```xml
<iq from='hag66@shakespeare.lit/pda'
    id='1x09df27'
    to='chat.shakespeare.lit'
    type='get'>
  <query xmlns='http://jabber.org/protocol/disco#info'/>
</iq>
```

The service MUST return its identity and the features it supports.

Listing 2: Service Returns Disco Info Results

```xml
<iq from='chat.shakespeare.lit'
    id='1x09df27'
    to='hag66@shakespeare.lit/pda'
    type='result'>
  <query xmlns='http://jabber.org/protocol/disco#info'>
    <identity
      category='conference'
      name='Shakespearean_Chat_Service'
      type='text'/>
    <feature var='http://jabber.org/protocol/muc'/>
  </query>
</iq>
```

6.2 Discovering Rooms

The service discovery items ("disco#items") protocol enables an entity to query a service for a list of associated items, which in the case of a chat service would consist of the specific chat rooms hosted by the service.

Listing 3: Entity Queries Chat Service for Rooms

```xml
<iq from='hag66@shakespeare.lit/pda'
    id='zb8q41f4'
    to='chat.shakespeare.lit'
    type='get'>
  <query xmlns='http://jabber.org/protocol/disco#items'/>
</iq>
```
The service SHOULD return a full list of the public rooms it hosts (i.e., not return any rooms that are hidden).

### Listing 4: Service Returns Disco Item Results

```xml
<iq from='chat.shakespeare.lit'
    id='zb8q41f4'
    to='hag66@shakespeare.lit/pda'
    type='result'>
  <query xmlns='http://jabber.org/protocol/disco#items'>
    <item jid='heath@chat.shakespeare.lit'
          name='A_Lonely_Heath'/>
    <item jid='coven@chat.shakespeare.lit'
          name='A_Dark_Cave'/>
    <item jid='forres@chat.shakespeare.lit'
          name='The_Palace'/>
    <item jid='inverness@chat.shakespeare.lit'
          name='Macbeth&amp;s_Castle'/>
  </query>
</iq>
```

If the full list of rooms is large (see XEP-0030 for details), the service MAY return only a partial list of rooms. If it does so, it SHOULD include a `<set/>` element qualified by the 'http://jabber.org/protocol/rsm' namespace (as defined in Result Set Management ⁹) to indicate that the list is not the full result set.

### Listing 5: Service Returns Limited List of Disco Item Results

```xml
<iq from='chat.shakespeare.lit'
    id='hx51v49s'
    to='hag66@shakespeare.lit/pda'
    type='result'>
  <query xmlns='http://jabber.org/protocol/disco#items'>
    <item jid='alls.well-that.ends.well@chat.shakespeare.lit'/>
    <item jid='as.you.like.it@chat.shakespeare.lit'/>
    <item jid='cleopatra@chat.shakespeare.lit'/>
    <item jid='comedy.of.errors@chat.shakespeare.lit'/>
    <item jid='coriolanus@chat.shakespeare.lit'/>
    <item jid='cymbeline@chat.shakespeare.lit'/>
    <item jid='hamlet@chat.shakespeare.lit'/>
    <item jid='henry.the.fourth.one@chat.shakespeare.lit'/>
    <item jid='henry.the.fourth.tw@chat.shakespeare.lit'/>
    <item jid='henry.the.fifth@chat.shakespeare.lit'/>
    <set xmlns='http://jabber.org/protocol/rsm'>
      <first index='0'>alls.well-that.ends.well@chat.shakespeare.lit</first>
      <last>henry.the.fifth@chat.shakespeare.lit</last>
    </set>
  </query>
</iq>
```

6.3 Querying for Room Information

Using the disco#info protocol, an entity may also query a specific chat room for more detailed information about the room. An entity SHOULD do so before entering a room in order to determine the privacy and security profile of the room configuration (see the Security Considerations for details).

Listing 6: Entity Queries for Information about a Specific Chat Room

```xml
<iq from='hag66@shakespeare.lit/pda'
    id='ik3vs715'
    to='coven@chat.shakespeare.lit'
    type='get'>
    <query xmlns='http://jabber.org/protocol/disco#info'/>
</iq>
```

The room MUST return its identity and SHOULD return the features it supports:

Listing 7: Room Returns Disco Info Results

```xml
<iq from='coven@chat.shakespeare.lit'
    id='ik3vs715'
    to='hag66@shakespeare.lit/pda'
    type='result'>
    <query xmlns='http://jabber.org/protocol/disco#info'>
        <identity
            category='conference'
            name='A_Dark_Cave'
            type='text'/>
        <feature var='http://jabber.org/protocol/muc'/>  
        <feature var='muc_passwordprotected'/>
        <feature var='muc_hidden'/>
        <feature var='muc_temporary'/>
        <feature var='muc_open'/>
        <feature var='muc_unmoderated'/>
        <feature var='muc_nonanonymous'/>
    </query>
</iq>
```

Note: The room SHOULD return the materially-relevant features it supports, such as password protection and room moderation (these are listed fully in the feature registry maintained by the XMPP Registrar; see also the XMPP Registrar section of this document).
A chatroom MAY return more detailed information in its disco#info response using Service Discovery Extensions 10, identified by inclusion of a hidden FORM_TYPE field whose value is 'http://jabber.org/protocol/muc#roominfo'. Such information might include a more verbose description of the room, the current room subject, and the current number of occupants in the room:

Listing 8: Room Returns Extended Disco Info Results

```xml
<iq from='coven@chat.shakespeare.lit' id='ik3vs715'
to='hag66@shakespeare.lit/pda'
type='result'>
<query xmlns='http://jabber.org/protocol/disco#info'>
  <identity
    category='conference'
    name='A_Dark_Cave'
    type='text'/>
  <feature var='http://jabber.org/protocol/muc'/>
  <feature var='muc_passwordprotected'/>
  <feature var='muc_hidden'/>
  <feature var='muc_temporary'/>
  <feature var='muc_open'/>
  <feature var='muc_unmoderated'/>
  <feature var='muc_nonanonymouse'/>
  <x xmlns='jabber:x:data' type='result'>
    <field var='FORM_TYPE' type='hidden'>
      <value>http://jabber.org/protocol/muc#roominfo</value>
    </field>
    <field var='muc#roominfo_description' label='Description'>
      <value>The place for all good witches!</value>
    </field>
    <field var='muc#roominfo_changesubject' label='Occupants_May_Change_the_Subject'>
      <value>true</value>
    </field>
    <field var='muc#roominfo_contactjid' label='Contact_Addresses'>
      <value>crone1@shakespeare.lit</value>
    </field>
    <field var='muc#roominfo_subject' label='Current_Discussion_Topic'>
      <value>Spells</value>
    </field>
    <field var='muc#roomconfig_changesubject' label='Subject_can_be_modified'>
      <value>true</value>
    </field>
    <field var='muc#roominfo_occupants' label='Number_of_occupants'>
```
Some extended room information is dynamically generated (e.g., the URL for discussion logs, which may be based on service-wide configuration), whereas other information is based on the more-stable room configuration, which is why any field defined for the muc#roomconfig FORM_TYPE can be included in the extended service discovery fields (as shown above for the muc#roomconfig_changesubject field).

Note: The foregoing extended service discovery fields for the 'http://jabber.org/protocol/muc#roominfo' FORM_TYPE are examples only and might be supplemented in the future via the mechanisms described in the Field Standardization section of this document.

6.4 Querying for Room Items

An entity MAY also query a specific chat room for its associated items:

Listing 9: Entity Queries for Items Associated with a Specific Chat Room

```xml
<iq from='hag66@shakespeare.lit/pda' id='k12fax27'
   to='coven@chat.shakespeare.lit'
   type='get'>
   <query xmlns='http://jabber.org/protocol/disco#items'/>
</iq>
```

An implementation MAY return a list of existing occupants if that information is publicly available, or return no list at all if this information is kept private. Implementations and deployments are advised to turn off such information sharing by default.
6 ENTITY USE CASES

Listing 10: Room Returns Disco Item Results (Items are Public)

```xml
<iq from='coven@chat.shakespeare.lit'
    id='kl2fax27'
    to='hag66@shakespeare.lit/pda'
    type='result'>
  <query xmlns='http://jabber.org/protocol/disco#items'>
    <item jid='coven@chat.shakespeare.lit/firstwitch'/>
    <item jid='coven@chat.shakespeare.lit/secondwitch'/>
  </query>
</iq>
```

Note: These <item/> elements are qualified by the disco#items namespace, not the muc namespace; this means that they cannot possess 'affiliation' or 'role' attributes, for example. If the list of occupants is private, the room MUST return an empty <query/> element, in accordance with XEP-0030.

Listing 11: Room Returns Empty Disco Item Results (Items are Private)

```xml
<iq from='coven@chat.shakespeare.lit'
    id='kl2fax27'
    to='hag66@shakespeare.lit/pda'
    type='result'>
  <query xmlns='http://jabber.org/protocol/disco#items'/>
</iq>
```

6.5 Querying a Room Occupant

If a non-occupant attempts to send a disco request to an address of the form <room@service/nick>, a MUC service MUST return a <bad-request/> error. If an occupant sends such a request, the service MAY pass it through the intended recipient; see the Implementation Guidelines section of this document for details.

6.6 Discovering Client Support for MUC

An entity might want to discover if one of the entity's contacts supports the Multi-User Chat protocol (e.g., before attempting to invite the contact to a room). This can be done using Service Discovery.

Listing 12: Entity Queries Contact Regarding MUC Support

```xml
<iq from='hag66@shakespeare.lit/pda'
    id='yh2fs843'
    to='wiccarocks@shakespeare.lit/laptop'
    type='get'>
  <query xmlns='http://jabber.org/protocol/disco#info'/>
</iq>
```
The client SHOULD return its identity and the features it supports.

Listing 13: Contact Returns Disco Info Results

```xml
<iq from='wiccarocks@shakespeare.lit/laptop'
    id='yh2fs843'
    to='hag66@shakespeare.lit/pda'
    type='result'>
    <query xmlns='http://jabber.org/protocol/disco#info'>
        <identity
            category='client'
            type='pc'/>
        ...
        <feature var='http://jabber.org/protocol/muc'/>
        ...
    </query>
</iq>
```

An entity may also query a contact regarding which rooms the contact is in. This is done by querying the contact’s full JID (<user@host/resource>) while specifying the well-known Service Discovery node ‘http://jabber.org/protocol/muc#rooms’.

Listing 14: Entity Queries Contact for Current Rooms

```xml
<iq from='hag66@shakespeare.lit/pda'
    id='gp7w61v3'
    to='wiccarocks@shakespeare.lit/laptop'
    type='get'>
    <query xmlns='http://jabber.org/protocol/disco#items'
        node='http://jabber.org/protocol/muc#rooms'/>
</iq>
```

Listing 15: Contact Returns Room Query Results

```xml
<iq from='wiccarocks@shakespeare.lit/laptop'
    id='gp7w61v3'
    to='hag66@shakespeare.lit/pda'
    type='result'>
    <query xmlns='http://jabber.org/protocol/disco#items'
        node='http://jabber.org/protocol/muc#rooms'>
        <item jid='coven@chat.shakespeare.lit'/>
        <item jid='characters@conference.shakespeare.lit'/>
    </query>
</iq>
```

Optionally, the contact MAY include its roomnick as the value of the 'name' attribute:
If this information is private, the user MUST return an empty <query/> element, in accordance with XEP-0030.

7 Occupant Use Cases

The main actor in a multi-user chat environment is the occupant, who can be said to be located "in" a multi-user chat room and to participate in the discussions held in that room (for the purposes of this specification, participants and visitors are considered to be "mere" occupants, since they possess no administrative privileges). As will become clear, the protocol elements proposed in this document to fulfill the occupant use cases fall into three categories:

1. the basic functionality for joining a room, exchanging messages with all occupants, etc. (supported by the "groupchat 1.0" protocol that preceded MUC)

2. straightforward additions to the basic functionality, such as handling of errors related to new room types

3. additional protocol elements to handle functionality not covered by "groupchat 1.0" (room invites, room passwords, extended presence related to room roles and affiliations); these are qualified by the 'http://jabber.org/protocol/muc#user' namespace

Note: All client-generated examples herein are presented from the perspective of the service, with the result that all stanzas received by a service contain a 'from' attribute corresponding to the sender's full JID as added by a normal XMPP router or session manager. In addition, normal IQ result stanzas sent upon successful completion of a request (as required by RFC 3920 11) are not shown.

7.1 Order of Events

The order of events involved in joining a room needs to be consistent so that clients can know which events to expect when. After a client sends presence to join a room, the MUC service MUST send it events in the following order:

1. In-room presence from other occupants
2. In-room presence from the joining entity itself (so-called "self-presence")
3. Room history (if any)
4. The room subject (if any)
5. Live messages, presence updates, new user joins, etc.

7.2 Entering a Room

7.2.1 Groupchat 1.0 Protocol

In order to participate in the discussions held in a multi-user chat room, a user MUST first become an occupant by entering the room. In the old "groupchat 1.0" protocol, this was done by sending presence to <room@service/nick>, where "room" is the room ID, "service" is the hostname of the chat service, and "nick" is the user's desired nickname within the room:

Listing 16: User Seeks to Enter a Room (Groupchat 1.0)

```xml
<presence
   from='hag66@shakespeare.lit/pda'
   to='coven@chat.shakespeare.lit/thirdwitch'/>
```

In this example, a user with a full JID of "hag66@shakespeare.lit/pda" has requested to enter the room "coven" on the "chat.shakespeare.lit" chat service with a room nickname of "thirdwitch".

If the user does not specify a room nickname, the service MUST return a <jid-malformed/> error:

Listing 17: No Nickname Specified

```xml
<presence
   from='coven@chat.shakespeare.lit'
   to='hag66@shakespeare.lit/pda'
   type='error'>
   <error type='modify'>
     <jid-malformed xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
   </error>
</presence>
```

7.2.2 Basic MUC Protocol

Compliant multi-user chat services MUST accept the foregoing as a request to enter a room from any client that knows either the "groupchat 1.0" (GC) protocol or the multi-user chat (MUC) protocol; however, MUC clients SHOULD signal their ability to speak the
MUC protocol by including in the initial presence stanza an empty <x/> element qualified by the 'http://jabber.org/protocol/muc' namespace (note the absence of the '#user' fragment):

Listing 18: User Seeks to Enter a Room (Multi-User Chat)

```
<presence>
  <from>hag66@shakespeare.lit/pda</from>
  <to>coven@chat.shakespeare.lit/thirdwitch</to>
  <x xmlns='http://jabber.org/protocol/muc'/>
</presence>
```

Note: If an error occurs in relation to joining a room, the service SHOULD include the MUC child element (i.e., <x xmlns='http://jabber.org/protocol/muc'/> in the <presence/> stanza of type 'error'.

Before attempting to enter the room, a MUC-compliant client SHOULD first discover its reserved room nickname (if any) by following the protocol defined in the Discovering Reserved Room Nickname section of this document.

7.2.3 Presence Broadcast

If the service is able to add the user to the room, it MUST send presence from all the existing occupants’ room JIDs to the new occupant’s full JID, including extended presence information about roles in a single <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'role' attribute set to a value of "moderator", "participant", or "visitor", and with the 'affiliation' attribute set to a value of "owner", "admin", "member", or "none" as appropriate. 12

Listing 19: Service Sends Presence from Existing Occupants to New Occupant

```
<presence>
  <from>coven@chat.shakespeare.lit/firstwitch</from>
  <to>hag66@shakespeare.lit/pda</to>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='owner' role='moderator'/>
  </x>
</presence>

<presence>
  <from>coven@chat.shakespeare.lit/secondwitch</from>
  <to>hag66@shakespeare.lit/pda</to>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='admin' role='moderator'/>
  </x>
</presence>
```

12The <presence/> element MUST NOT include more than once instance of the <x/> qualified by the 'http://jabber.org/protocol/muc#user' namespace.
In this example, the user from the previous example has entered the room, by which time two other people had already entered the room: a user with a room nickname of "firstwitch" (who is a room owner) and a user with a room nickname of "secondwitch" (who is a room admin). The service MUST also send presence from the new occupant’s room JID to the full JIDs of all the occupants (including the new occupant).

Listing 20: Service Sends New Occupant’s Presence to All Occupants

```xml
<presence>
  <from>coven@chat.shakespeare.lit/thirdwitch</from>
  <to>crone1@shakespeare.lit/desktop</to>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member' role='participant'/>
  </x>
</presence>

<presence>
  <from>coven@chat.shakespeare.lit/thirdwitch</from>
  <to>wiccarocks@shakespeare.lit/laptop</to>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member' role='participant'/>
  </x>
</presence>

<presence>
  <from>coven@chat.shakespeare.lit/thirdwitch</from>
  <to>hag66@shakespeare.lit/pda</to>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member' role='participant'/>
    <status code='110'/>
  </x>
</presence>
```

In this example, initial room presence is being sent from the new occupant (thirdwitch) to all occupants, including the new occupant. As shown in the last stanza, the presence sent by the room to a user from itself as an occupant SHOULD include a status code of 110 so that the user knows this presence refers to itself as an occupant.

The service MAY rewrite the new occupant’s roomnick (e.g., if roomnicks are locked down). If the service does not accept the new occupant’s requested roomnick but instead assigns a new roomnick, it MUST include a status code of ”210” in the presence broadcast that it sends to the new occupant.

Listing 21: Service Sends New Occupant’s Presence to New Occupant

```xml
<presence>
  <from>coven@chat.shakespeare.lit/thirdwitch</from>
  <to>hag66@shakespeare.lit/pda</to>
  <x xmlns='http://jabber.org/protocol/muc#user'>
```

23
Note: The order of the presence stanzas sent to the new occupant is important. The service MUST first send the complete list of the existing occupants to the new occupant and only then send the new occupant's own presence to the new occupant. This helps the client know when it has received the complete "room roster".
After sending the presence broadcast (and only after doing so), the service may then send discussion history, live messages, presence updates, and other in-room traffic.

7.2.4 Default Roles

The following table summarizes the initial default roles that a service should set based on the user's affiliation (there is no role associated with the "outcast" affiliation, since such users are not allowed to enter the room).

<table>
<thead>
<tr>
<th>Room Type</th>
<th>None</th>
<th>Member</th>
<th>Admin</th>
<th>Owner</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moderated</td>
<td>Visitor</td>
<td>Participant</td>
<td>Moderator</td>
<td>Moderator</td>
</tr>
<tr>
<td>Unmoderated</td>
<td>Participant</td>
<td>Participant</td>
<td>Moderator</td>
<td>Moderator</td>
</tr>
<tr>
<td>Members-Only</td>
<td>N/A *</td>
<td>Participant</td>
<td>Moderator</td>
<td>Moderator</td>
</tr>
<tr>
<td>Open</td>
<td>Participant</td>
<td>Participant</td>
<td>Moderator</td>
<td>Moderator</td>
</tr>
</tbody>
</table>

* Entry is not permitted.

7.2.5 Non-Anonymous Rooms

If the room is non-anonymous, the service MUST send the new occupant's full JID to all occupants using extended presence information in an \(<x/>\) element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an \(<item/>\) child with a 'jid' attribute specifying the occupant's full JID:

Listing 22: Service Sends Full JID to All Occupants

```xml
<presence
    from='coven@chat.shakespeare.lit/thirdwitch'
    to='crone1@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='none'
      jid='hag66@shakespeare.lit/pda'
      role='participant'/>
  </x>
</presence>
```
If the user is entering a room that is non-anonymous (i.e., which informs all occupants of each occupant’s full JID as shown above), the service SHOULD allow the user to enter the room but MUST also warn the user that the room is not anonymous. This SHOULD be done by including a status code of "100" in the initial presence that the room sends to the new occupant:

Listing 23: Service Sends New Occupant’s Presence to New Occupant

```xml
<presence>
  <from>coven@chat.shakespeare.lit/thirdwitch</from>
  <to>hag66@shakespeare.lit/pda</to>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member' role='participant'/>
    <status code='100'/>
    <status code='110'/>
    <status code='210'/>
  </x>
</presence>
```

However, it MAY be done by sending a message of type "groupchat" to the new occupant containing an <x/> child with a <status/> element that has the 'code' attribute set to a value of "100":

Listing 24: Service Warns New Occupant About Lack of Anonymity

```xml
<message>
  <from>coven@chat.shakespeare.lit</from>
  <to>hag66@shakespeare.lit/pda</to>
  <type>groupchat</type>
  <body>This room is not anonymous.</body>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <status code='100'/>
  </x>
</message>
```

The inclusion of the status code assists clients in presenting their own notification messages (e.g., information appropriate to the user’s locality).

7.2.6 Semi-Anonymous Rooms

If the room is semi-anonymous, the service MUST send presence from the new occupant to all occupants as specified above, but MUST include the new occupant’s full JID only in the presence notifications it sends to occupants with a role of "moderator" and not to non-moderator occupants.
(Note: All subsequent examples include the 'jid' attribute for each <item/> element, even though this information is not sent to non-moderators in semi-anonymous rooms.)

7.2.7 Password-Protected Rooms

If the room requires a password and the user did not supply one (or the password provided is incorrect), the service MUST deny access to the room and inform the user that they are unauthorized; this is done by returning a presence stanza of type "error" specifying a <not-authorized/> error:

Listing 25: Service Denies Access Because No Password Provided

```xml
<presence type='error'>
  <from>coven@chat.shakespeare.lit</from>
  <to>hag66@shakespeare.lit/pda</to>
  <x xmlns='http://jabber.org/protocol/muc'/>
  <error type='auth'>
    <not-authorized xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</presence>
```

Passwords SHOULD be supplied with the presence stanza sent when entering the room, contained within an <x/> element qualified by the 'http://jabber.org/protocol/muc' namespace and containing a <password/> child. Passwords are to be sent as cleartext; no other authentication methods are supported at this time, and any such authentication or authorization methods shall be defined in a separate specification (see the Security Considerations section of this document).

Listing 26: User Provides Password On Entering a Room

```xml
<presence from='hag66@shakespeare.lit/pda' to='coven@chat.shakespeare.lit/thirdwitch'>
  <x xmlns='http://jabber.org/protocol/muc'/>
  <password>cauldronburn</password>
</presence>
```

7.2.8 Members-Only Rooms

If the room is members-only but the user is not on the member list, the service MUST deny access to the room and inform the user that they are not allowed to enter the room; this is done by returning a presence stanza of type "error" specifying a <registration-required/> error condition:
7.2.9 Banned Users

If the user has been banned from the room (i.e., has an affiliation of "outcast"), the service MUST deny access to the room and inform the user of the fact that he or she is banned; this is done by returning a presence stanza of type "error" specifying a <forbidden/> error condition:

Listing 28: Service Denies Access Because User is Banned

```xml
<presence
   from='coven@chat.shakespeare.lit'
   to='hag66@shakespeare.lit/pda'
   type='error'>
   <x xmlns='http://jabber.org/protocol/muc'/>
   <error type='auth'>
     <forbidden xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
   </error>
</presence>
```

7.2.10 Nickname Conflict

If the room already contains another user with the nickname desired by the user seeking to enter the room (or if the nickname is reserved by another user on the member list), the service MUST deny access to the room and inform the user of the conflict; this is done by returning a presence stanza of type "error" specifying a <conflict/> error condition:

Listing 29: Service Denies Access Because of Nick Conflict

```xml
<presence
   from='coven@chat.shakespeare.lit'
   to='hag66@shakespeare.lit/pda'
   type='error'>
   <x xmlns='http://jabber.org/protocol/muc'/>
   <error type='cancel'>
     <conflict xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
   </error>
</presence>
```
However, if the bare JID <localpart@domain.tld> of the present occupant matches the bare JID of the user seeking to enter the room, then the service SHOULD allow entry to the user, so that the user has two (or more) in-room “sessions” with the same roomnick, one for each resource. If a service allows more than one occupant with the same bare JID and the same room nickname, it SHOULD route in-room messages to all of the user’s resources and allow all of the user’s resources to send messages to the room; it is up to the implementation to determine how to appropriately handle presence from the user’s resources and how to route private messages to all or only one resource (based on presence priority or some other algorithm).

How nickname conflicts are determined is up to the implementation (e.g., whether the service applies a case folding routine, a stringprep profile such as Resourceprep or Nodeprep, etc.).

7.2.11 Max Users

If the room has reached its maximum number of occupants, the service SHOULD deny access to the room and inform the user of the restriction; this is done by returning a presence stanza of type “error” specifying a <service-unavailable/> error condition:

```
Listing 30: Service Informs User that Room Occupant Limit Has Been Reached
<presence
    from='coven@chat.shakespeare.lit'
    to='hag66@shakespeare.lit/pda'
    type='error'>
  <x xmlns='http://jabber.org/protocol/muc'/>
  <error type='wait'>
    <service-unavailable xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</presence>
```

Alternatively, the room could kick an "idle user" in order to free up space.

If the room has reached its maximum number of occupants and a room admin or owner attempts to join, the room SHOULD allow the admin or owner to join, up to some reasonable number of additional occupants, which number MAY be configurable.

7.2.12 Locked Room

If a user attempts to enter a room while it is "locked" (i.e., before the room creator provides an initial configuration and therefore before the room officially exists), the service MUST refuse entry and return an <item-not-found/> error to the user:
7. OCCUPANT USE CASES

Listing 31: Service Denies Access Because Room Does Not Exist

```xml
<presence
  from='coven@chat.shakespeare.lit'
  to='hag66@shakespeare.lit/pda'
  type='error'>
  <x xmlns='http://jabber.org/protocol/muc'/>
  <error type='cancel'>
    <item-not-found xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</presence>
```

7.2.13 Nonexistent Room

If the room does not already exist when the user seeks to enter it, the service SHOULD create it; however, this is not required, since an implementation or deployment MAY choose to restrict the privilege of creating rooms. For details, see the Creating a Room section of this document.

7.2.14 Room Logging

If the user is entering a room in which the discussions are logged to a public archive (often accessible via HTTP), the service SHOULD allow the user to enter the room but MUST also warn the user that the discussions are logged. This SHOULD be done by including a status code of "170" in the initial presence that the room sends to the new occupant:

Listing 32: Service Sends New Occupant’s Presence to New Occupant

```xml
<presence
  from='coven@chat.shakespeare.lit/thirdwitch'
  to='hag66@shakespeare.lit/pda'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member' role='participant'/>
    <status code='100'/>
    <status code='110'/>
    <status code='170'/>
    <status code='210'/>
  </x>
</presence>
```

7.2.15 Discussion History

After sending initial presence as shown above, a room MAY send discussion history to the new occupant. (The room MUST NOT send any discussion history before it finishes sending room presence as specified in the Presence Broadcast section of this document.) Whether such
history is sent, and how many messages comprise the history, shall be determined by the chat service implementation or specific deployment.

Listing 33: Delivery of Discussion History

```xml
<message
  from='coven@chat.shakespeare.lit/firstwitch'
  to='hecate@shakespeare.lit/broom'
  type='groupchat'>
  <body>Thrice the brinded cat hath mew'd.</body>
</message>

<message
  from='coven@chat.shakespeare.lit/secondwitch'
  to='hecate@shakespeare.lit/broom'
  type='groupchat'>
  <body>Thrice_and_once_the_hedge-pig_whined.</body>
</message>

<message
  from='coven@chat.shakespeare.lit/thirdwitch'
  to='hecate@shakespeare.lit/broom'
  type='groupchat'>
  <body>Harpier_cries_'Tis_time,_'tis_time.</body>
</message>
```

Discussion history messages MUST be stamped with Delayed Delivery\textsuperscript{13} information qualified by the 'urn:xmpp:delay' namespace to indicate that they are sent with delayed delivery and to specify the times at which they were originally sent. (Note: The 'urn:xmpp:delay' namespace defined in XEP-0203 supersedes the older 'jabber:x:delay' namespace defined in Legacy Delayed Delivery\textsuperscript{14}; until the status of XEP-0091 is changed to Obsolete, implementations SHOULD include both datetime formats.) The 'from' attribute SHOULD be the full JID of the original sender in non-anonymous rooms, but MUST NOT be in semi-anonymous rooms (where the 'from' attribute SHOULD be set to the JID of the room itself). The service SHOULD send all discussion history messages before delivering any "live" messages sent after the user enters the room.

7.2.16 Managing Discussion History

A user MAY want to manage the amount of discussion history provided on entering a room (perhaps because the user is on a low-bandwidth connection or is using a small-footprint client). This MUST be accomplished by including a <history/> child in the initial presence stanza sent when joining the room. There are four allowable attributes for this element:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Datatype</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxchars</td>
<td>int</td>
<td>Limit the total number of characters in the history to &quot;X&quot; (where the character count is the characters of the complete XML stanzas, not only their XML character data).</td>
</tr>
<tr>
<td>maxstanzas</td>
<td>int</td>
<td>Limit the total number of messages in the history to &quot;X&quot;.</td>
</tr>
<tr>
<td>seconds</td>
<td>int</td>
<td>Send only the messages received in the last &quot;X&quot; seconds.</td>
</tr>
<tr>
<td>since</td>
<td>dateTime</td>
<td>Send only the messages received since the datetime specified (which MUST conform to the DateTime profile specified in XMPP Date and Time Profiles XEP-0082: XMPP Date and Time Profiles <a href="http://xmpp.org/extensions/xep-0082.html">http://xmpp.org/extensions/xep-0082.html</a>).</td>
</tr>
</tbody>
</table>

The service MUST send the smallest amount of traffic that meets any combination of the above criteria, taking into account service-level and room-level defaults. The service MUST send complete message stanzas only (i.e., it MUST not literally truncate the history at a certain number of characters, but MUST send the largest number of complete stanzas that results in a number of characters less than or equal to the 'maxchars' value specified). If the client wishes to receive no history, it MUST set the 'maxchars' attribute to a value of "0" (zero).

The following examples illustrate the use of this protocol.

Listing 34: User Requests Limit on Number of Messages in History

```xml
<presence
   from='hag66@shakespeare.lit/pda'
   to='coven@chat.shakespeare.lit/thirdwitch'>
<x xmlns='http://jabber.org/protocol/muc'>
   <history maxstanzas='20'/>
</x>
</presence>
```
Listing 35: User Requests History in Last 3 Minutes

```xml
<presence
  from='hag66@shakespeare.lit/pda' 
  to='coven@chat.shakespeare.lit/thirdwitch'>
  <x xmlns='http://jabber.org/protocol/muc'>
    <history seconds='180'/>
  </x>
</presence>
```

Listing 36: User Requests All History Since the Beginning of the Unix Era

```xml
<presence
  from='hag66@shakespeare.lit/pda' 
  to='coven@chat.shakespeare.lit/thirdwitch'>
  <x xmlns='http://jabber.org/protocol/muc'>
    <history since='1970-01-01T00:00:00Z'/>
  </x>
</presence>
```

Obviously the service SHOULD NOT return all messages sent in the room since the beginning of the Unix era, and SHOULD appropriately limit the amount of history sent to the user based on service or room defaults.

Listing 37: User Requests No History

```xml
<presence
  from='hag66@shakespeare.lit/pda' 
  to='coven@chat.shakespeare.lit/thirdwitch'>
  <x xmlns='http://jabber.org/protocol/muc'>
    <history maxchars='0'/>
  </x>
</presence>
```

7.3 Exiting a Room

In order to exit a multi-user chat room, an occupant sends a presence stanza of type "unavailable" to the <room@service/nick> it is currently using in the room.

Listing 38: Occupant Exits a Room

```xml
<presence
  from='hag66@shakespeare.lit/pda' 
  to='coven@chat.shakespeare.lit/thirdwitch'
  type='unavailable'/>
```

The service MUST then send presence stanzas of type "unavailable" from the departing occupant's room JID to the full JIDs of the departing occupant and of the remaining occupants:
Presence stanzas of type “unavailable” reflected by the room MUST contain extended presence information about roles and affiliations; the ‘role’ attribute SHOULD be set to a value of “none” to denote that the individual is no longer an occupant.

The occupant MAY include normal <status/> information in the unavailable presence stanzas; this enables the occupant to provide a custom exit message if desired:

```
Listing 40: Custom Exit Message
<presence
  from='wiccarocks@shakespeare.lit/laptop'
  to='coven@chat.shakespeare.lit/oldhag'
  type='unavailable'>
  <status>gone where the goblins go</status>
</presence>
```

Normal presence stanza generation rules apply as defined in XMPP IM\(^{15}\), so that if the user sends a general unavailable presence stanza, the user’s server will broadcast that stanza to the <room@service/nick> to which the user’s client has sent directed presence.

It is possible that a user may not be able to gracefully exit the room by sending unavailable

---

presence directly to the room. If the user goes offline without sending unavailable presence, the user’s server is responsible for sending unavailable presence on behalf of the user (in accordance with RFC 3921). If the user’s server goes offline or connectivity is lost between the user’s server and the MUC service to which the user is connected (e.g., in federated communications), the MUC service is responsible for monitoring error stanzas it receives in order to determine if the user has gone offline. If the MUC service determines that the user has gone offline, it must treat the user as if the user had itself sent unavailable presence. Note: If the room is not persistent and this occupant is the last to exit, the service is responsible for destroying the room.

7.4 Changing Nickname

A common feature of multi-user chat rooms is the ability for an occupant to change his or her nickname within the room. In MUC this is done by sending updated presence information to the room, specifically by sending presence to a new room JID in the same room (changing only the resource identifier in the room JID).

Listing 41: Occupant Changes Nickname

```xml
<presence
  from='hag66@shakespeare.lit/pda'
  to='coven@chat.shakespeare.lit/oldhag'/>
```

The service then sends two presence stanzas to the full JID of each occupant (including the occupant who is changing his or her room nickname), one of type "unavailable" for the old nickname and one indicating availability for the new nickname. The unavailable presence MUST contain the following as extended presence information in an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace:

- The new nickname (in this case, nick='oldhag')
- A status code of 303

This enables the recipients to correlate the old roomnick with the new roomnick.

Listing 42: Service Updates Nick

```xml
<presence
  from='coven@chat.shakespeare.lit/thirdwitch'
  to='crone1@shakespeare.lit/desktop'
  type='unavailable'>
<x xmlns='http://jabber.org/protocol/muc#user'>
  <item affiliation='member'
    jid='hag66@shakespeare.lit/pda'
    nick='oldhag'
```
role='participant'/>
<status code='303'/>
</x>
</presence>
<presence
from='coven@chat.shakespeare.lit/thirdwitch'
to='wiccarocks@shakespeare.lit/laptop'
type='unavailable'>
<x xmlns='http://jabber.org/protocol/muc#user'>
<item affiliation='member'
    jid='hag66@shakespeare.lit/pda'
    nick='oldhag'
    role='participant'/>
<status code='303'/>
</x>
</presence>
<presence
from='coven@chat.shakespeare.lit/thirdwitch'
to='hag66@shakespeare.lit/pda'
type='unavailable'>
<x xmlns='http://jabber.org/protocol/muc#user'>
<item affiliation='member'
    jid='hag66@shakespeare.lit/pda'
    nick='oldhag'
    role='participant'/>
<status code='303'/>
<status code='110'/>
</x>
</presence>
<presence
from='coven@chat.shakespeare.lit/oldhag'
to='crone1@shakespeare.lit/desktop'>
<x xmlns='http://jabber.org/protocol/muc#user'>
<item affiliation='member'
    jid='hag66@shakespeare.lit/pda'
    role='participant'/>
</x>
</presence>
<presence
from='coven@chat.shakespeare.lit/oldhag'
to='wiccarocks@shakespeare.lit/laptop'>
<x xmlns='http://jabber.org/protocol/muc#user'>
<item affiliation='member'
    jid='hag66@shakespeare.lit/pda'
    role='participant'/>
</x>
</presence>
<presence>
If the user attempts to change his or her room nickname to a room nickname that is already in use by another user (or that is reserved by another user affiliated with the room, e.g., a member or owner), the service MUST deny the nickname change request and inform the user of the conflict; this is done by returning a presence stanza of type "error" specifying a <conflict/> error condition:

Listing 43: Service Denies Nickname Change Because of Nick Conflict

```xml
<presence
   from='coven@chat.shakespeare.lit/oldhag'
   to='hag66@shakespeare.lit/pda'>
   <x xmlns='http://jabber.org/protocol/muc#user'>
      <item affiliation='member'
            jid='hag66@shakespeare.lit/pda'
            role='participant'/>
   </x>
</presence>
```

However, if the bare JID <localpart@domain.tld> of the present occupant matches the bare JID of the user seeking to change his or her nickname, then the service MAY allow the nickname change. See the Nickname Conflict section of this document for details.

If the user attempts to change his or her room nickname but room nicknames are "locked down", the service MUST deny the nickname change request and return a presence stanza of type "error" specifying a <not-acceptable/> error condition:

Listing 44: Service Denies Nickname Change Because Roomnicks Are Locked Down

```xml
<presence
   from='coven@chat.shakespeare.lit/oldhag'
   to='hag66@shakespeare.lit/pda'>
   <x xmlns='http://jabber.org/protocol/muc#user'>
      <not-acceptable xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
   </x>
</presence>
```
The user SHOULD then discover its reserved nickname as specified in the Discovering Reserved Room Nickname section of this document.

7.5 Changing Availability Status

In multi-user chat systems such as IRC, one common use for changing one’s room nickname is to indicate a change in one’s availability (e.g., changing one’s room nickname to “third-witch|away”). In XMPP, availability is of course noted by a change in presence (specifically the <show/> and <status/> elements), which can provide important context within a chatroom. An occupant changes availability status within the room by sending the updated presence to its <room@service/nick>.

Listing 45: Occupant Changes Availability Status

```
<presence
   from='wiccarocks@shakespeare.lit/laptop'
   to='coven@chat.shakespeare.lit/oldhag'>
   <show>xa</show>
   <status>gone where the goblins go</status>
</presence>
```

The service then sends a presence stanza from the occupant changing his or her presence to the full JID of each occupant, including extended presence information about the occupant’s role and full JID to those with privileges to view such information:

Listing 46: Service Passes Along Changed Presence to All Occupants

```
<presence
   from='coven@chat.shakespeare.lit/secondwitch'
   to='crone1@shakespeare.lit/desktop'>
   <show>xa</show>
   <status>gone where the goblins go</status>
   <x xmlns='http://jabber.org/protocol/muc#user'>
      <item affiliation='admin'
            jid='wiccarocks@shakespeare.lit/laptop'
            role='moderator'/>
   </x>
</presence>
```

[ ... ]
7.6 Inviting Another User to a Room

7.6.1 Direct Invitation

A method for sending a direct invitation (not mediated by the room itself) is defined in Direct MUC Invitations\(^\text{16}\). Sending the invitation directly can help to work around communications blocking on the part of the invitee (which might refuse communication with entities not in its roster).

7.6.2 Mediated Invitation

It can be useful to invite another user to a room in which one is an occupant. To do this, a MUC client MUST send XML of the following form to the <room@service> itself (the reason is OPTIONAL and the message MUST be explicitly or implicitly of type "normal"):

Listing 47: Occupant Sends an Invitation by Way of Room

```
<message
    from='cronel@shakespeare.lit/desktop'
    to='coven@chat.shakespeare.lit'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <invite to='hecate@shakespeare.lit'>
      <reason>
        Hey Hecate, this is the place for all good witches!
      </reason>
    </invite>
  </x>
</message>
```

The <room@service> itself MUST then add a `from` address to the <invite/> element whose value is the bare JID, full JID, or room JID of the invitor and send the invitation to the invitee specified in the `to` address (the service MAY include a message body explaining the invitation or containing the reason, for the sake of older clients; in addition, the room SHOULD add the password if the room is password-protected):

Listing 48: Room Sends Invitation to Invitee on Behalf of Invitor

```
<message
    from='coven@chat.shakespeare.lit'
    to='hecate@shakespeare.lit'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <invite from='cronel@shakespeare.lit/desktop'>
      <reason>
        Hey Hecate, this is the place for all good witches!
      </reason>
    </invite>
  </x>
</message>
```

If the room is members-only, the service MAY also add the invitee to the member list. (Note: Invitation privileges in members-only rooms SHOULD be restricted to room admins; if a member without privileges to edit the member list attempts to invite another user, the service SHOULD return a <forbidden/> error to the occupant; for details, see the Modifying the Member List section of this document.)

If the invitor supplies a non-existent JID, the room SHOULD return an <item-not-found/> error to the invitor.

The invitee MAY choose to formally decline (as opposed to ignore) the invitation; and this is something that the sender may want to be informed about. In order to decline the invitation, the invitee MUST send a message of the following form to the <room@service> itself:

**Listing 49: Invitee Declines Invitation**

```
<message
  from='hecate@shakespeare.lit/broom'
  to='coven@chat.shakespeare.lit'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <decline to='crone1@shakespeare.lit'>
      <reason>
        Sorry, I'm too busy right now.
      </reason>
    </decline>
  </x>
</message>
```

**Listing 50: Room Informs Invitor that Invitation Was Declined**

```
<message
  from='coven@chat.shakespeare.lit'
  to='crone1@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <decline from='hecate@shakespeare.lit'>
      <reason>
        Sorry, I'm too busy right now.
      </reason>
    </decline>
  </x>
</message>
```

It may be wondered why the invitee does not send the decline message directly to the invitor. The main reason is that certain implementations MAY choose to base invitations on room JIDs rather than bare JIDs (so that, for example, an occupant could invite someone from one room to another without knowing that person’s bare JID). Thus the service MUST handle both the
invites and declines.

7.7 Converting a One-to-One Chat Into a Multi-User Conference

Sometimes it is desirable to convert a one-to-one chat into a multi-user conference. The process flow is shown in the following examples. First, two users begin a one-to-one chat.

Listing 51: A One-to-One Chat

```
<message
  from='crone1@shakespeare.lit/desktop'
  to='wiccarocks@shakespeare.lit/laptop'
  type='chat'>
  <thread>e0ffe42b28561960c6b12b944a092794b9683a38</thread>
  <body>Thrice the brinded cat hath mew'd.</body>
</message>

<message
  from='wiccarocks@shakespeare.lit/laptop'
  to='crone1@shakespeare.lit/desktop'
  type='chat'>
  <thread>e0ffe42b28561960c6b12b944a092794b9683a38</thread>
  <body>Thrice and once the hedge-pig whined.</body>
</message>
```

Now the first person decides to include a third person in the discussion, so she (or, more precisely, her client) does the following:

1. Creates a new multi-user chatroom
2. Optionally sends history of the one-to-one chat to the room
3. Sends an invitation to the second person and the third person, including a `<continue/>` element (optionally including a 'thread' attribute).

Note: The new room SHOULD be non-anonymous, MAY be an instant room as specified in the Creating an Instant Room section of this document, and MAY have a unique room name received from the service as specified in the Requesting a Unique Room Name section of this document.

Note: If the one-to-one chat messages included a `<thread/>` element, the person who creates the room SHOULD include the ThreadID with the history messages, specify the ThreadID in the invitations as the value of the `<continue/>` element’s 'thread' attribute, and include the ThreadID in any new messages sent to the room. Use of ThreadIDs is RECOMMENDED because it helps to provide continuity between the one-to-one chat and the multi-user chat.
Listing 52: Continuing the Discussion I: User Creates Room

```xml
<presence>
  from='crone1@shakespeare.lit/desktop'
  to='coven@chat.shakespeare.lit/firstwitch'>
</presence>

<presence>
  from='coven@chat.shakespeare.lit/firstwitch'
  to='crone1@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc'/>
</presence>
```

Listing 53: Continuing the Discussion II: Owner Sends History to Room

```xml
<message>
  from='crone1@shakespeare.lit/desktop'
  to='coven@chat.shakespeare.lit'
  type='groupchat'>
  <thread>e0ffe42b2b561960c6b12b944a092794b9683a38</thread>
  <body>Thrice the brinded cat hath mew'd.</body>
  <delay xmlns='urn:xmpp:delay'>
    <stamp>2004-09-29T01:54:37Z</stamp>
  </delay>
</message>

<message>
  from='crone1@shakespeare.lit/desktop'
  to='coven@chat.shakespeare.lit'
  type='groupchat'>
  <thread>e0ffe42b2b561960c6b12b944a092794b9683a38</thread>
  <body>Thrice_and_once_the_hedge-pig_whined.</body>
  <delay xmlns='urn:xmpp:delay'>
    <stamp>2004-09-29T01:55:21Z</stamp>
  </delay>
</message>
```

Note: Use of the Delayed Delivery protocol enables the room creator to specify the datetime of each message from the one-to-one chat history (via the 'stamp' attribute), as well as the JID of the original sender of each message (via the 'from' attribute). The room creator SHOULD send the complete one-to-one chat history before inviting additional users to the room, and SHOULD also send as history any messages appearing in the one-to-one chat interface after joining the room and before the second person joins the room; if the one-to-one history is especially large, the sending client may want to send the history over a few seconds rather than all at once (to avoid triggering rate limits). The service SHOULD NOT add its own delay
elements (as described in the Discussion History section of this document) to prior chat history messages received from the room owner.

Listing 54: Continuing the Discussion III: Owner Sends Invitations, Including Continue Flag

```xml
<message from='cronel@shakespeare.it/desktop' to='coven@chat.shakespeare.it'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <from>'cronel@shakespeare.it/laptop'</from>
    <reason>This coven needs both wiccarocks and hag66.</reason>
    <continue thread='e0ffe42b28561960c6b12b944a092794b9683a38'/>
  </x>
</message>
```

Note: Since the invitor’s client knows the full JID of the person with whom the invitor was having a one-to-one chat, it SHOULD include the full JID (rather than the bare JID) in the invitation.

The invitations are delivered to the invitees:

Listing 55: Invitations Delivered

```xml
<message from='coven@chat.shakespeare.it' to='wiccarocks@shakespeare.it/laptop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <from>'cronel@shakespeare.it'</from>
    <reason>This coven needs both wiccarocks and hag66.</reason>
    <continue thread='e0ffe42b28561960c6b12b944a092794b9683a38'/>
  </x>
</message>

<message from='coven@chat.shakespeare.it' to='hag66@shakespeare.it'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <from>'cronel@shakespeare.it'</from>
    <reason>This coven needs both wiccarocks and hag66.</reason>
    <continue thread='e0ffe42b28561960c6b12b944a092794b9683a38'/>
  </x>
</message>
```
When the client being used by <wiccarocks@shakespeare.lit/laptop> receives the invitation, it SHOULD auto-join the room or prompt the user whether to join (subject to user preferences) and then seamlessly convert the existing one-to-one chat window into a multi-user conferencing window:

Listing 56: Invitee Accepts Invitation, Joins Room, and Receives Presence and History

```
<presence
  from='wiccarocks@shakespeare.lit/laptop'
  to='coven@chat.shakespeare.lit/secondwitch'>
  <x xmlns='http://jabber.org/protocol/muc'/>
</presence>

<presence

  <delay xmlns='urn:xmpp:delay'
    from='wiccarocks@shakespeare.lit/laptop'
    stamp='2004-09-29T01:55:21Z'/>
```
Note: The fact that the messages come from the <room@service> itself rather than <room@service/nick> is a clue to the receiving client that these messages are prior chat history, since any message from a room occupant will have a 'from' address equal to the sender’s room JID.

7.8 Occupant Modification of the Room Subject

If allowed in accordance with room configuration, a mere occupant MAY be allowed to change the subject in a room. For details, see the Modifying the Room Subject section of this document.

7.9 Sending a Private Message

Since each occupant has a unique room JID, an occupant MAY send a "private message" to a selected occupant via the service by sending a message to the occupant’s room JID. The message type SHOULD be "chat" and MUST NOT be "groupchat", but MAY be left unspecified (i.e., a normal message). This privilege SHOULD be allowed to any occupant (even a visitor in a moderated room).

Listing 57: Occupant Sends Private Message

```xml
<message>
  <from>Wiccarocks@shakespeare.lit/laptop</from>
  <to>coven@chat.shakespeare.lit/firstwitch</to>
  <type>chat</type>
  <body>I'll give thee a wind.</body>
</message>
```

The service is responsible for changing the 'from' address to the sender’s room JID and delivering the message to the intended recipient’s full JID.

Listing 58: Recipient Receives the Private Message

```xml
<message>
  <from>coven@chat.shakespeare.lit/secondwitch</from>
  <to>crone1@shakespeare.lit/desktop</to>
  <type>chat</type>
  <body>I'll give thee a wind.</body>
</message>
```

If the sender attempts to send a private message of type "groupchat" to a particular occupant, the service MUST refuse to deliver the message (since the recipient’s client would expect in-room messages to be of type "groupchat") and return a <bad-request/> error to the sender.
Listing 59: Occupant Attempts to Send a Message of Type "Groupchat" to a Particular Occupant

```
<message
   from='wiccarocks@shakespeare.lit/laptop'
   to='coven@chat.shakespeare.lit/firstwitch'
   type='groupchat'>
   <body>I'll give thee a wind.</body>
</message>

<message
   from='coven@chat.shakespeare.lit'
   to='wiccarocks@shakespeare.lit/laptop'
   type='error'>
   <body>I'll give thee a wind.</body>
   <error_type>modify</error_type>
   <bad-request xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
</message>
```

If the sender attempts to send a private message to a room JID that does not exist, the service MUST return an <item-not-found/> error to the sender.

If the sender is not an occupant of the room in which the intended recipient is visiting, the service MUST return a <not-acceptable/> error to the sender.

7.10 Sending a Message to All Occupants

An occupant sends a message to all other occupants in the room by sending a message of type "groupchat" to the <room@service> itself (a service MAY ignore or reject messages that do not have a type of "groupchat"). In a moderated room, this privilege is restricted to occupants with a role of participant or higher.

Listing 60: Occupant Sends a Message to All Occupants

```
<message
   from='hag66@shakespeare.lit/pda'
   to='coven@chat.shakespeare.lit'
   type='groupchat'>
   <body>Harpier cries: 'tis_time, 'tis time.</body>
</message>
```

If the sender has voice in the room (this is the default except in moderated rooms), the service MUST change the 'from' attribute to the sender’s room JID and reflect the message out to the full JID of each occupant.

Listing 61: Service Reflects Message to All Occupants

```
<message
```
If the sender is a visitor (i.e., does not have voice in a moderated room), the service MAY return a <forbidden/> error to the sender and MUST NOT reflect the message to all occupants. If the sender is not an occupant of the room, the service SHOULD return a <not-acceptable/> error to the sender and SHOULD NOT reflect the message to all occupants; the only exception to this rule is that an implementation MAY allow users with certain privileges (e.g., a room owner, room admin, or service-level admin) to send messages to the room even if those users are not occupants.

7.11 Registering with a Room

An implementation MAY allow an unaffiliated user (in a moderated room, normally a participant) to register with a room and thus become a member of the room (conversely, an implementation MAY restrict this privilege and allow only room admins to add new members). In particular, it is not possible to join a members-only room without being on the member list, so an entity may need to request membership in order to join such a room. If allowed, this functionality SHOULD be implemented by enabling a user to send a request for registration requirements to the room qualified by the 'jabber:iq:register' namespace as described in In-Band Registration 17:

Listing 62: User Requests Registration Requirements

```xml
<iq from='hag66@shakespeare.lit/pda'
     id='reg1'
     to='coven@chat.shakespeare.lit'
     type='get'>
   <query xmlns='jabber:iq:register'/>
</iq>
```

If the user requesting registration requirements is not allowed to register with the room (e.g., because that privilege has been restricted), the room MUST return a &lt;not-allowed/&gt; error to the user. If the user is already registered, the room MUST reply with an IQ stanza of type "result" that contains an empty &lt;register/&gt; element as described in XEP-0077. If the room does not exist, the service MUST return an &lt;item-not-found/&gt; error. Otherwise, the room MUST then return a Data Form to the user (as described in Data Forms 18). The information required to register MAY vary by implementation or deployment and is not fully specified in this document (e.g., the fields registered by this document for the 'http://jabber.org/protocol/muc#register' FORM_TYPE may be supplemented in the future via the mechanisms described in the Field Standardization section of this document). The following can be taken as a fairly typical example:

<table>
<thead>
<tr>
<th>Listing 63: Service Returns Registration Form</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;iq from='<a href="mailto:coven@chat.shakespeare.lit">coven@chat.shakespeare.lit</a>'</td>
</tr>
<tr>
<td>id='reg1'</td>
</tr>
<tr>
<td>to='<a href="mailto:hag66@shakespeare.lit">hag66@shakespeare.lit</a>/pda'</td>
</tr>
<tr>
<td>type='result'&gt;</td>
</tr>
<tr>
<td>&lt;query xmlns='jabber:iq:register'</td>
</tr>
<tr>
<td>&lt;instructions&gt;</td>
</tr>
<tr>
<td>To register on the web, visit <a href="http://shakespeare.lit/">http://shakespeare.lit/</a></td>
</tr>
<tr>
<td>&lt;/instructions&gt;</td>
</tr>
<tr>
<td>&lt;x xmlns='jabber:x:data' type='form'&gt;</td>
</tr>
<tr>
<td>&lt;title&gt;Dark Cave Registration&lt;/title&gt;</td>
</tr>
<tr>
<td>&lt;instructions&gt;</td>
</tr>
<tr>
<td>Please provide the following information</td>
</tr>
<tr>
<td>to register with this room.</td>
</tr>
<tr>
<td>&lt;/instructions&gt;</td>
</tr>
<tr>
<td>&lt;field</td>
</tr>
<tr>
<td>type='hidden'</td>
</tr>
<tr>
<td>var='FORM_TYPE'&gt;</td>
</tr>
<tr>
<td>&lt;/field&gt;</td>
</tr>
<tr>
<td>&lt;field</td>
</tr>
<tr>
<td>label='Given_Name'</td>
</tr>
<tr>
<td>type='text-single'</td>
</tr>
<tr>
<td>var='muc#register_first'&gt;</td>
</tr>
<tr>
<td>&lt;/field&gt;</td>
</tr>
<tr>
<td>&lt;field</td>
</tr>
<tr>
<td>label='Family_Name'</td>
</tr>
<tr>
<td>type='text-single'</td>
</tr>
<tr>
<td>var='muc#register_last'&gt;</td>
</tr>
<tr>
<td>&lt;/field&gt;</td>
</tr>
</tbody>
</table>

18 XEP-0004: Data Forms &lt;http://xmpp.org/extensions/xep-0004.html&gt;.
The user SHOULD then submit the form:

```
List 64: User Submits Registration Form

<iq from='hag66@shakespeare.lit/pda' id='reg2' to='coven@chat.shakespeare.lit' type='set'>
  <query xmlns='jabber:iq:register'>
    <x xmlns='jabber:x:data' type='submit'>
      <field var='FORM_TYPE'>
        <value>http://jabber.org/protocol/muc#register</value>
      </field>
      <field var='muc#register_first'>
        <value>Brunhilde</value>
      </field>
      <field var='muc#register_last'>
        <value>Entwhistle-Throckmorton</value>
      </field>
      <field var='muc#register_roomnick'>
        <value>thirdwitch</value>
      </field>
      <field var='muc#register_url'>
        <value>http://witchesonline/~hag66</value>
      </field>
    </x>
  </query>
</iq>
```
If the desired room nickname is already reserved for that room, the room MUST return a <conflict/> error to the user:

**Listing 65: Room Returns Conflict Error to User**

```xml
<iq from='coven@chat.shakespeare.lit'
     id='reg2'
     to='hag66@shakespeare.lit/pda'
     type='error'>
  <error type='cancel'>
    <conflict xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</iq>
```

If the room or service does not support registration, it MUST return a <service-unavailable/> error to the user:

**Listing 66: Room Returns Service Unavailable Error to User**

```xml
<iq from='coven@chat.shakespeare.lit'
     id='reg2'
     to='hag66@shakespeare.lit/pda'
     type='error'>
  <error type='cancel'>
    <service-unavailable xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</iq>
```

If the user did not include a valid data form, the room MUST return a <bad-request/> error to the user:

**Listing 67: Room Returns Service Bad Request Error to User**

```xml
<iq from='coven@chat.shakespeare.lit'
     id='reg2'
     to='hag66@shakespeare.lit/pda'
     type='error'>
  <error type='modify'>
    <bad-request xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</iq>
```
Otherwise, the room MUST inform the user that the registration request was successfully received:

Listing 68: Room Informs User that Registration Request Has Been Processed

```xml
<iq from='coven@chat.shakespeare.lit' id='reg2' to='hag66@shakespeare.lit/pda' type='result'/>
```

After the user submits the form, the service MAY request that the submission be approved by a room admin/owner (see the Approving Registration Requests section of this document) or MAY immediately add the user to the member list by changing the user's affiliation from "none" to "member". If the service changes the user's affiliation and the user is in the room, it MUST send updated presence from this individual to all occupants, indicating the change in affiliation by including an </x> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item> child with the 'affiliation' attribute set to a value of "member".

Listing 69: Service Sends Notice of Membership to All Occupants

```xml
<presence from='coven@chat.shakespeare.lit/thirdwitch' to='crone1@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member' jid='hag66@shakespeare.lit/pda' role='participant'/>
  </x>
</presence>
```

If a user has registered with a room, the room MAY choose to restrict the user to use of the registered nickname only in that room. If it does so, it SHOULD return a <not-acceptable/> error to the user if the user attempts to join the room with a roomnick other than the user's registered roomnick (this enables a room to "lock down" roomnicks for consistent identification of occupants).

7.12 Getting Member List

If allowed in accordance with room configuration, an occupant MAY be allowed to retrieve the list of room members. For details, see the Modifying the Member List section of this document.
7.13 Discovering Reserved Room Nickname

A user MAY have a reserved room nickname, for example through explicit room registration, database integration, or nickname “lockdown”. A user SHOULD discover his or her reserved nickname before attempting to enter the room. This is done by sending a Service Discovery information request to the room JID while specifying a well-known Service Discovery node of "x-roomuser-item".

Listing 70: User Requests Reserved Nickname

```xml
<iq from='hag66@shakespeare.lit/pda'
   id='getnick1'
   to='coven@chat.shakespeare.lit'
   type='get'>
   <query xmlns='http://jabber.org/protocol/disco#info'
     node='x-roomuser-item'/>
</iq>
```

It is OPTIONAL for a multi-user chat service to support the foregoing service discovery node. If the room or service does not support the foregoing service discovery node, it MUST return a <feature-not-implemented/> error to the user. If it does and the user has a registered nickname, it MUST return the nickname to the user as the value of the 'name' attribute of a Service Discovery <identity/> element (for which the category/type SHOULD be "conference/text"):

Listing 71: Room Returns Nickname

```xml
<iq from='coven@chat.shakespeare.lit'
   id='getnick1'
   to='hag66@shakespeare.lit/pda'
   type='result'>
   <query xmlns='http://jabber.org/protocol/disco#info'
     node='x-roomuser-item'>
     <identity
       category='conference'
       name='thirldwitch'
       type='text'/>
   </query>
</iq>
```

If the user does not have a registered nickname, the room MUST return a service discovery <query/> element that is empty (in accordance with XEP-0030).

Even if a user has registered one room nickname, the service SHOULD allow the user to specify a different nickname on entering the room (e.g., in order to join from different client resources), although the service MAY choose to "lock down" nicknames and therefore deny entry to the user, including a <not-acceptable/> error. The service MUST NOT return an error to the user if his or her client sends the foregoing request after having already joined the room, but instead SHOULD reply as previously described.
If another user attempts to join the room with a nickname reserved by the first user, the service MUST deny entry to the second user and return a <conflict/> error as previously described.

7.14 Requesting Voice

It is not possible for a visitor to speak (i.e., send a message to all occupants) in a moderated room. To request voice, a visitor SHOULD send a <message/> stanza containing a data form to the room itself, where the data form contains only a 'muc#role' field with a value of "participant".

Listing 72: Occupant Requests Voice

```
<message from='hag66@shakespeare.lit/pda'
    to='coven@chat.shakespeare.lit'>
    <x xmlns='jabber:x:data' type='submit'>
        <field var='FORM_TYPE'>
            <value>http://jabber.org/protocol/muc#request</value>
        </field>
        <field var='muc#role' type='text-single'>
            <value>Participant</value>
        </field>
    </x>
</message>
```

The service then SHOULD forward the request to the room moderator(s) as described in the Approving Voice Requests section of this document.

8 Moderator Use Cases

A moderator has privileges to perform certain actions within the room (e.g., to change the roles of some occupants) but does not have rights to change persistent information about affiliations (which may be changed only by an admin or owner) or defining information about the room. Exactly which actions may be performed by a moderator is subject to configuration. However, for the purposes of the MUC framework, moderators are stipulated to have privileges to perform the following actions:

1. discover an occupant's full JID in a semi-anonymous room (occurs by default as shown above)
2. modify the subject
3. kick a participant or visitor from the room
4. grant or revoke voice in a moderated room
5. modify the list of occupants who have voice in a moderated room

These features shall be implemented with a request/response exchange using <iq/> elements that contain children qualified by the 'http://jabber.org/protocol/muc#admin' namespace. The examples below illustrate the protocol interactions to implement the desired functionality. (Except where explicitly noted below, any of the following administrative requests MUST be denied if the <user@host> of the 'from' address of the request does not match the bare JID portion of one of the moderators; in this case, the service MUST return a <forbidden/> error.)

8.1 Modifying the Room Subject

A common feature of multi-user chat rooms is the ability to change the subject within the room. By default, only users with a role of "moderator" SHOULD be allowed to change the subject in a room (although this SHOULD be configurable, with the result that a mere participant or even visitor may be allowed to change the subject if desired). The subject is changed by sending a message of type "groupchat" to the <room@service>, where the <message/> MUST contain a <subject/> element that specifies the new subject but SHOULD NOT contain any other element (e.g., no <body/> element or <thread/> element).

Listing 73: Moderator Changes Subject

```xml
<message
    from='wiccarocks@shakespeare.lit/laptop'
    to='coven@chat.shakespeare.lit'
    type='groupchat'>
  <subject>Fire Burn and Cauldron Bubble!</subject>
</message>
```

If a MUC service receives such a message, it MUST reflect the message to all other occupants with a 'from' address equal to the room JID that corresponds to the sender of the subject change:

Listing 74: Service Informs All Occupants of Subject Change

```xml
<message
    from='coven@chat.shakespeare.lit/secondwitch'
    to='crone1@shakespeare.lit/desktop'
    type='groupchat'>
  <subject>Fire Burn and Cauldron Bubble!</subject>
</message>
```

[ ... ]
In addition, the room SHOULD include the last subject change in the discussion history sent when a new occupant joins the room. A MUC client that receives such a message MAY choose to display an in-room message, such as the following:

Listing 75: Client Displays Room Subject Change Message

```xml
<subject><from>coven@chat.shakespeare.lit</from><type>error</type><subject>Fire Burn and Cauldron Bubble!</subject></subject>
```

If someone without appropriate privileges attempts to change the room subject, the service MUST return a message of type "error" specifying a <forbidden/> error condition:

Listing 76: Service Returns Error Related to Unauthorized Subject Change

```xml
<message from='coven@chat.shakespeare.lit' to='hag66@shakespeare.lit/pda' type='error'>
  <subject>Fire Burn and Cauldron Bubble!</subject>
  <error type='auth'>
    <forbidden xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</message>
```

In order to remove the existing subject but not provide a new subject (i.e., set the subject to be empty), the client shall send an empty <subject/> element (i.e., either "<subject/>") or "<subject></subject>").

Listing 77: Moderator Sets Empty Subject

```xml
<message from='wiccarocks@shakespeare.lit/laptop' to='coven@chat.shakespeare.lit' type='groupchat'>
  <subject/>
</message>
```

8.2 Kicking an Occupant

A moderator has permissions kick certain kinds of occupants from a room (which occupants are "kickable" depends on service provisioning, room configuration, and the moderator's affiliation -- see below). The kick is normally performed based on the occupant's room nickname (though it MAY be based on the full JID) and is completed by setting the role of a participant or visitor to a value of "none".
Listing 78: Moderator Kicks Occupant

```xml
<iq from='fluellen@shakespeare.lit/pda'
    id='kick1'
    to='harfleur@henryv.shakespeare.lit'
    type='set'>
    <query xmlns='http://jabber.org/protocol/muc#admin'>
        <item nick='pistol' role='none'>
            <reason>Avaunt, you cullion!</reason>
        </item>
    </query>
</iq>
```

The service MUST remove the kicked occupant by sending a presence stanza of type "unavailable" to each kicked occupant, including status code 307 in the extended presence information, optionally along with the reason (if provided) and the bare JID of the user who initiated the kick.

Listing 79: Service Removes Kicked Occupant

```xml
<presence
    from='harfleur@henryv.shakespeare.lit/pistol'
    to='pistol@shakespeare.lit/harfleur'
    type='unavailable'>
    <x xmlns='http://jabber.org/protocol/muc#user'>
        <item affiliation='none' role='none'>
            <actor jid='fluellen@shakespeare.lit'/>
            <reason>Avaunt, you cullion!</reason>
        </item>
    </x>
    <status code='307'/>
</presence>
```

The inclusion of the status code assists clients in presenting their own notification messages (e.g., information appropriate to the user's locality). The optional inclusion of the reason and actor enable the kicked user to understand why he or she was kicked, and by whom if the kicked occupant would like to discuss the matter. 19

After removing the kicked occupant(s), the service MUST then inform the moderator of success:

Listing 80: Service Informs Moderator of Success

```xml
<iq from='harfleur@henryv.shakespeare.lit'
    id='kick1'
    to='fluellen@shakespeare.lit/pda'
    type='result'/>
```

19Some commentors have complained that this opens room owners and administrators up to potential abuse; unfortunately, with great power comes great responsibility.
After informing the moderator, the service MUST then inform all of the remaining occupants that the kicked occupant is no longer in the room by sending presence stanzas of type "unavailable" from the individual’s roomnick (<room@service/nick>) to all the remaining occupants (just as it does when occupants exit the room of their own volition), including the status code and optionally the reason and actor.

Listing 81: Service Informs Remaining Occupants

```
<presence
    from='harfleur@henryv.shakespeare.lit/pistol'
    to='gower@shakespeare.lit/cell'
    type='unavailable'>
    <x xmlns='http://jabber.org/protocol/muc#user'>
        <item affiliation='none' role='none'/>
        <status code='307'/>
    </x>
</presence>
```

A user cannot be kicked by a moderator with a lower affiliation. Therefore, if a moderator who is a participant attempts to kick an admin or a moderator who is a participant or admin attempts to kick an owner, the service MUST deny the request and return a <not-allowed/> error to the sender:

Listing 82: Service Returns Error on Attempt to Kick User With Higher Affiliation

```
<iq from='coven@chat.shakespeare.lit'
    id='kicktest'
    to='wiccarocks@shakespeare.lit/laptop'
    type='error'>
    <query xmlns='http://jabber.org/protocol/muc#admin'>
        <item nick='firstwitch' role='none'>
            <reason>Be gone!</reason>
        </item>
    </query>
    <not-allowed xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
</iq>
```

If a moderator attempts to kick himself, the service MAY deny the request and return a <conflict/> error to the sender. (Although the act of kicking oneself may seem odd, it is common in IRC as a way of apologizing for one’s actions in the room.)
8.3 Granting Voice to a Visitor

In a moderated room, a moderator may want to manage who does and does not have "voice" in the room (i.e., the ability to send messages to all occupants). Voice is granted based on the visitor's room nickname, which the service will convert into the visitor's full JID internally. The moderator grants voice to a visitor by changing the visitor's role to "participant".

Listing 83: Moderator Grants Voice to a Visitor

```xml
<iq from='crone1@shakespeare.lit/desktop' id='voice1' to='coven@chat.shakespeare.lit' type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item nick='thirdwitch' role='participant'/>
  </query>
</iq>
```

The <reason/> element is OPTIONAL:

Listing 84: Moderator Grants Voice to a Visitor (With a Reason)

```xml
<iq from='crone1@shakespeare.lit/desktop' id='voice1' to='coven@chat.shakespeare.lit' type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item nick='thirdwitch' role='participant'>
      <reason>A worthy witch indeed!</reason>
    </item>
  </query>
</iq>
```

The service MUST then inform the moderator of success:

Listing 85: Service Informs Moderator of Success

```xml
<iq from='coven@chat.shakespeare.lit' id='voice1' to='crone1@shakespeare.lit/desktop' type='result'/>
```

The service MUST then send updated presence from this individual's <room@service/nick> to all occupants, indicating the addition of voice privileges by including an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'role' attribute set to a value of "participant".
8.4 Revoking Voice from a Participant

In a moderated room, a moderator may want to revoke a participant’s privileges to speak. The moderator can revoke voice from a participant by changing the participant’s role to “visitor”:

Listing 87: Moderator Revokes Voice from a Participant

```
<iq from='crone@shakespeare.lit/desktop'
    id='voice2' 
    to='coven@chat.shakespeare.lit' 
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item nick='thirdwitch'
          role='visitor'/>
  </query>
</iq>
```

The `<reason/>` element is OPTIONAL:

Listing 88: Moderator Revokes Voice from a Visitor (With a Reason)

```
<iq from='crone@shakespeare.lit/desktop'
    id='voice2' 
    to='coven@chat.shakespeare.lit' 
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item nick='thirdwitch'
          role='visitor'>
      <reason>Not so worthy after all!</reason>
    </item>
  </query>
</iq>
```
The service MUST then inform the moderator of success:

Listing 89: Service Informs Moderator of Success

```xml
<iq from='coven@chat.shakespeare.lit' id='voice2' to='crone1@shakespeare.lit/desktop' type='result'/>
```

The service MUST then send updated presence from this individual to all occupants, indicating the removal of voice privileges by sending a presence element that contains an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'role' attribute set to a value of "visitor".

Listing 90: Service Notes Loss of Voice

```xml
<presence
    from='coven@chat.shakespeare.lit/thirdwitch'
    to='crone1@shakespeare.lit/desktop'>
    <x xmlns='http://jabber.org/protocol/muc#user'>
      <item affiliation='member'
            jid='hag66@shakespeare.lit/pda'
            role='visitor'/>
    </x>
</presence>

[ ... ]
```

A moderator MUST NOT be able to revoke voice from a user whose affiliation is at or above the moderator's level. In addition, a service MUST NOT allow the voice privileges of an admin or owner to be removed by anyone. If a moderator attempts to revoke voice privileges from such a user, the service MUST deny the request and return a <not-allowed/> error to the sender along with the offending item(s):

Listing 91: Service Returns Error on Attempt to Revoke Voice from an Admin, Owner, or User with a Higher Affiliation

```xml
<iq from='coven@chat.shakespeare.lit' id='voicetest' to='crone1@shakespeare.lit/desktop' type='error'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item nick='secondwitch' role='visitor'/>
  </query>
  <error type='cancel'>
    <not-allowed xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</iq>
```
8.5 Modifying the Voice List

A moderator in a moderated room may want to modify the voice list. To do so, the moderator first requests the voice list by querying the room for all occupants with a role of 'participant'.

Listing 92: Moderator Requests Voice List

```xml
<iq from='bard@shakespeare.lit/globe'
    id='voice3'
    to='goodfolk@chat.shakespeare.lit'
    type='get'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item role='participant'/>
  </query>
</iq>
```

The service MUST then return the voice list to the moderator; each item MUST include the 'nick' and 'role' attributes and SHOULD include the 'affiliation' and 'jid' attributes:

Listing 93: Service Sends Voice List to Moderator

```xml
<iq from='goodfolk@chat.shakespeare.lit'
    id='voice3'
    to='bard@shakespeare.lit/globe'
    type='result'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='none'
          jid='polonius@hamlet/castle'
          nick='Polo'
          role='participant'/>
    <item affiliation='none'
          jid='horatio@hamlet/castle'
          nick='Horotoro'
          role='participant'/>
    <item affiliation='member'
          jid='hecate@shakespeare.lit/broom'
          nick='Hecate'
          role='participant'/>
  </query>
</iq>
```

The moderator MAY then modify the voice list. In order to do so, the moderator MUST send the changed items (i.e., only the "delta") back to the service; each item MUST include the 'nick' attribute and 'role' attribute (normally set to a value of "participant" or "visitor") but SHOULD NOT include the 'jid' attribute and MUST NOT include the 'affiliation' attribute (which is used to manage affiliations such as owner rather than the participant role):
The service MUST then inform the moderator of success:

Listing 95: Service Informs Moderator of Success

```xml
<i q from='goodfolk@chat.shakespeare.lit' id='voice1' to='bard@shakespeare.lit/globe' type='result'/>
```

The service MUST then send updated presence for any affected individuals to all occupants, indicating the change in voice privileges by sending the appropriate extended presence stanzas as described in the foregoing use cases.

As noted, voice privileges cannot be revoked from a room owner or room admin, nor from any user with a higher affiliation than the moderator making the request. If a room admin attempts to revoke voice privileges from such a user by modifying the voice list, the service MUST deny the request and return a <not-allowed/> error to the sender:

Listing 96: Service Returns Error on Attempt to Revoke Voice from an Admin, Owner, or User with a Higher Affiliation

```xml
<i q from='goodfolk@chat.shakespeare.lit' id='voicetest' to='bard@shakespeare.lit/globe' type='error'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item jid='hecate@shakespeare.lit' nick='Hecate' role='visitor'/>
  </query>
</i q>
```
8.6 Approving Voice Requests

As noted in the Requesting Voice section of this document, when a service receives a request for voice from an occupant it SHOULD forward that request to the room moderator(s). To do so, the service SHOULD send a `<message/>` stanza to the room moderator(s), where the `<message/>` stanza contains a data form asking for approval or denial of the request, as shown below.

Listing 97: Voice Request Approval Form

```xml
<message from='coven@chat.shakespeare.lit'
    id='approve'
    to='crone1@shakespeare.lit/pda'>
    <xml xmlns='jabber:x:data' type='form'>
        <title>Voice request</title>
        <instructions>
            To approve this request for voice, select the &quot;Grant voice to this person?&quot; checkbox and click OK. To skip this request, click the cancel button.
        </instructions>
        <field var='FORM_TYPE' type='hidden'>
            <value>http://jabber.org/protocol/muc#request</value>
        </field>
        <field var='muc#role'
            type='text-single'
            label='Requested_role'>
            <value>participant</value>
        </field>
        <field var='muc#jid'
            type='text-single'
            label='User_ID'>
            <value>hag66@shakespeare.lit/pda</value>
        </field>
        <field var='muc#roomnick'
            type='text-single'
            label='Room_Nickname'>
            <value>thirdwitch</value>
        </field>
        <field var='muc#request_allow'
            type='boolean'
            label='Grant_voice_to_this_person?'>
            <value>false</value>
        </field>
    </xml>
</message>
```
In order to approve the request, a moderator shall submit the form:

Listing 98: Voice Request Approval Submission

```xml
<message from='crone1@shakespeare.lit/pda' id='approve' to='coven@chat.shakespeare.lit'>
  <x xmlns='jabber:x:data' type='submit'>
    <field var='FORM_TYPE' type='hidden'>
      <value>http://jabber.org/protocol/muc#request</value>
    </field>
    <field var='muc#role'>
      <value>participant</value>
    </field>
    <field var='muc#jid'>
      <value>hag66@shakespeare.lit/pda</value>
    </field>
    <field var='muc#roomnick'>
      <value>thirdwitch</value>
    </field>
    <field var='muc#request_allow'>
      <value>true</value>
    </field>
  </x>
</message>
```

If a moderator approves the voice request, the service shall grant voice to the occupant and send a presence update as described in the Granting Voice to a Visitor section of this document.

9 Admin Use Cases

A room administrator has privileges to modify persistent information about user affiliations (e.g., by banning users) and to grant and revoke moderator privileges, but does not have rights to change the defining features of the room, which are the sole province of the room owner(s). Exactly which actions may be performed by a room admin will be subject to configuration. However, for the purposes of the MUC framework, room admins are stipulated to at a minimum have privileges to perform the following actions:

1. ban a user from the room
2. modify the list of users who are banned from the room
3. grant or revoke membership
4. modify the member list
5. grant or revoke moderator privileges
6. modify the list of moderators

These features shall be implemented with a request/response exchange using <iq/> elements that contain children qualified by the 'http://jabber.org/protocol/muc#admin' namespace. The examples below illustrate the protocol interactions that implement the desired functionality. (Except where explicitly noted below, any of the following administrative requests MUST be denied if the <user@host> of the 'from' address of the request does not match the bare JID of one of the room admins; in this case, the service MUST return a <forbidden/> error.)

9.1 Banning a User

An admin or owner can ban one or more users from a room. The ban MUST be performed based on the occupant's bare or full JID. In order to ban a user, an admin MUST change the user's affiliation to "outcast".

Listing 99: Admin Bans User

```xml
<iq from='kinghenryv@shakespeare.lit/throne'
    id='ban1'
    to='southampton@henryv.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='outcast'
          jid='earlofcambridge@shakespeare.lit'/>
  </query>
</iq>
```

The <reason/> element is OPTIONAL.

Listing 100: Admin Bans User (With a Reason)

```xml
<iq from='kinghenryv@shakespeare.lit/throne'
    id='ban1'
    to='southampton@henryv.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='outcast'
          jid='earlofcambridge@shakespeare.lit'>
      <reason>Treason</reason>
    </item>
  </query>
</iq>
```
The service MUST add that JID to the ban list, SHOULD remove the outcast’s nickname from the list of registered nicknames, and MUST inform the admin or owner of success:

Listing 101: Service Informs Admin or Owner of Success

```xml
<iq from='southampton@henryv.shakespeare.lit' id='ban1' to='kinghenryv@shakespeare.lit/throne' type='result'/>
```

The service MUST also remove any banned users who are in the room by sending a presence stanza of type “unavailable” to each banned occupant, including status code 301 in the extended presence information, optionally along with the reason (if provided) and the bare JID of the user who initiated the ban.

Listing 102: Service Removes Banned User

```xml
<presence
  from='southampton@henryv.shakespeare.lit/cambridge'
  to='earlofcambridge@shakespeare.lit/stabber'
  type='unavailable'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='outcast' role='none'>
      <actor jid='kinghenryv@shakespeare.lit'/><reason>Treason</reason>
    </item>
  </x>
  <status code='301'/>
</presence>
```

The inclusion of the status code assists clients in presenting their own notification messages (e.g., information appropriate to the user’s locality). The optional inclusion of the reason and actor enable the banned user to understand why he or she was banned, and by whom if the banned user would like to discuss the matter. The service MUST then inform all of the remaining occupants that the banned user is no longer in the room by sending presence stanzas of type “unavailable” from the banned user to all remaining occupants (just as it does when occupants exit the room of their own volition), including the status code and optionally the reason and actor:

Listing 103: Service Informs Remaining Occupants

```xml
<presence
  type='unavailable'
  from='southampton@henryv.shakespeare.lit/cambridge'
  to='exeter@shakespeare.lit/pda'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='outcast'
```
As with Kicking an Occupant, a user cannot be banned by an admin with a lower affiliation. Therefore, if an admin attempts to ban an owner, the service MUST deny the request and return a <not-allowed/> error to the sender.

Listing 104: Service Returns Error on Attempt to Ban User With Higher Affiliation

```xml
<iq from='kinghenryv@shakespeare.lit/throne'
    id='ban1' to='southampton@henryv.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='outcast'>
      <jid>earlofcambridge@shakespeare.lit</jid>
      <reason>Treason</reason>
    </item>
  </query>
<error type='cancel'>
  <not-allowed xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
</error>
</iq>
```

If an admin or owner attempts to ban himself, the service MUST deny the request and return a <conflict/> error to the sender. (Note: This is different from the recommended service behavior on kicking oneself, which a service may allow.)

9.2 Banning a Service

An admin or owner can ban all users of a service. The ban MUST be performed based on the domain of that service. In order to ban all users that have a domain part matching the service’s domain, an admin MUST change the service’s affiliation to "outcast".

Listing 105: Admin Bans Service

```xml
<iq from='kinghenryv@shakespeare.lit/throne'
    id='ban2' to='southampton@henryv.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='outcast'
```
 ADMIN USE CASES

```xml
<jid='mozart.lit'/>
</query>
</iq>
```

The `<reason/>` element is OPTIONAL.

### Listing 106: Admin Bans Service (With a Reason)

```xml
<iq from='kinghenryv@shakespeare.lit/throne'
     id='ban2'
     to='southampton@henryv.shakespeare.lit'
     type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='outcast'
          jid='mozart.lit'>
      <reason>Treason</reason>
    </item>
  </query>
</iq>
```

The service MUST add that domain to the ban list, SHOULD remove all nickname’s of users with a matching domainpart from the list of registered nicknames, and MUST inform the admin or owner of success:

### Listing 107: Service Informs Admin or Owner of Success

```xml
<iq from='southampton@henryv.shakespeare.lit'
     id='ban2'
     to='kinghenryv@shakespeare.lit/throne'
     type='result'/> 
```

The service MUST also remove any banned users who are in the room by sending a presence stanza of type ”unavailable” to each banned occupant, including status code 301 in the extended presence information, optionally along with the reason (if provided) and the bare JID of the user who initiated the ban.

### Listing 108: Service Removes Banned User

```xml
<presence
      from='southampton@henryv.shakespeare.lit/musician'
      to='willy@mozart.lit/piano'
      type='unavailable'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='outcast' role='none'>
      <actor jid='kinghenryv@shakespeare.lit'/> 
    <reason>Treason</reason>
  </item>
</presence>
```

```xml
<status code='301'/>
```
The inclusion of the status code assists clients in presenting their own notification messages (e.g., information appropriate to the user’s locality). The optional inclusion of the reason and actor enable the banned user to understand why he or she was banned, and by whom if the banned user would like to discuss the matter. The service MUST then inform all of the remaining occupants that the banned user is no longer in the room by sending presence stanzas of type “unavailable” from the banned user to all remaining occupants (just as it does when occupants exit the room of their own volition), including the status code and optionally the reason and actor:

**Listing 109: Service Informs Remaining Occupants**

```xml
<presence
  type='unavailable'
  from='southampton@henryv.shakespeare.lit/musician'
  to='exeter@Shakespeare.lit/pda'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='outcast'
          jid='willy@mozart.lit/piano'
          role='none'/>
    <status code='301'/>
  </x>
</presence>
```

[...]

### 9.3 Modifying the Ban List

A room admin may want to modify the ban list. To modify the list of banned JIDs, the admin first requests the ban list by querying the room for all entities with an affiliation of ‘outcast’.

**Listing 110: Admin Requests Ban List**

```xml
<iq from='kinghenryv@shakespeare.lit/throne'
     id='ban2'
     to='southampton@henryv.shakespeare.lit'
     type='get'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='outcast'/>
  </query>
</iq>
```

The service MUST then return the list of banned entities to the admin; each item MUST include the ‘affiliation’ and ‘jid’ attributes but SHOULD NOT include the ‘nick’ and ‘role’ attributes:
Listing 111: Service Sends Ban List to Admin

```xml
<iq from='southampton@henryv.shakespeare.lit'
    id='ban2'
    to='kinghenryv@shakespeare.lit/throne'
    type='result'>
    <query xmlns='http://jabber.org/protocol/muc#admin'>
        <item affiliation='outcast'
            jid='earlofcambridge@shakespeare.lit'>
            <reason>Treason</reason>
        </item>
    </query>
</iq>
```

The admin MAY then modify the ban list. In order to do so, the admin MUST send the changed items (i.e., only the "delta") back to the service; each item MUST include the 'affiliation' attribute (normally set to a value of "outcast" to ban or "none" to remove ban) and 'jid' attribute but SHOULD NOT include the 'nick' attribute and MUST NOT include the 'role' attribute (which is used to manage roles such as participant rather than the outcast affiliation); in addition, the reason and actor elements are OPTIONAL:

Listing 112: Admin Sends Modified Ban List to Service

```xml
<iq from='kinghenryv@shakespeare.lit/throne'
    id='ban3'
    to='southampton@henryv.shakespeare.lit'
    type='set'>
    <query xmlns='http://jabber.org/protocol/muc#admin'>
        <item affiliation='outcast'
            jid='earlofcambridge@shakespeare.lit'>
            <reason>Treason</reason>
        </item>
        <item affiliation='outcast'
            jid='lordscroop@shakespeare.lit'>
            <reason>Treason</reason>
        </item>
        <item affiliation='outcast'
            jid='sirthomasgrey@shakespeare.lit'>
            <reason>Treason</reason>
        </item>
    </query>
</iq>
```

After updating the ban list, the service MUST inform the admin of success:

Listing 113: Service Informs Admin of Success

```xml
<iq from='southampton@henryv.shakespeare.lit'
    id='ban3'>
</iq>
```
The service MUST then remove the affected occupants (if they are in the room) and send updated presence (including the appropriate status code) from them to all the remaining occupants as described in the “Banning a User” use case. (The service SHOULD also remove each banned user’s reserved nickname from the list of reserved roomnicks, if appropriate.)

9.4 Granting Membership to a User

An admin can grant membership to a user; this is done by changing the user’s affiliation to “member” (normally based on nick if the user is in the room, or on bare or full JID if not; in either case, if the nick is provided, that nick becomes the user’s default nick in the room if that functionality is supported by the implementation):

Listing 114: Admin Grants Membership

```xml
<iq from='crone1@shakespeare.lit/desktop'
   id='member1'
   to='coven@chat.shakespeare.lit'
   type='set'>
   <query xmlns='http://jabber.org/protocol/muc#admin'>
     <item affiliation='member'
           jid='hag66@shakespeare.lit'/>
   </query>
</iq>
```

The `<reason/>` element is OPTIONAL.

Listing 115: Admin Grants Membership (With a Reason)

```xml
<iq from='crone1@shakespeare.lit/desktop'
   id='member1'
   to='coven@chat.shakespeare.lit'
   type='set'>
   <query xmlns='http://jabber.org/protocol/muc#admin'>
     <item affiliation='member'
           jid='hag66@shakespeare.lit'>
       <reason>A worthy witch indeed!</reason>
     </item>
   </query>
</iq>
```

The service MUST add the user to the member list and then inform the admin of success:

Listing 116: Service Informs Admin of Success
If the user is in the room, the service MUST then send updated presence from this individual to all occupants, indicating the granting of membership by including an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'affiliation' attribute set to a value of "member".

Listing 117: Service Sends Notice of Membership to All Occupants

```xml
<iq xmlns='jabber:iq:privacy'
    from='coven@chat.shakespeare.lit'
    id='member1'
    to='crone1@shakespeare.lit/desktop'
    type='result'/>
```

If the user is not in the room, the service MAY send a message from the room itself to the room occupants, indicating the granting of membership by including an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'affiliation' attribute set to a value of "member".

Listing 118: Service Sends Notice of Membership to All Occupants

```xml
<presence
    from='coven@chat.shakespeare.lit/thirdwitch'
    to='crone1@shakespeare.lit/desktop'>
    
    <x xmlns='http://jabber.org/protocol/muc#user'>
      <item affiliation='member'
             jid='hag66@shakespeare.lit/pda'
             role='participant'/>  
    </x>
  
</presence>
```

[...]

9.5 Granting Membership to a Service

An admin can grant membership to all users of a service; this is done by adding the service’s domain to the member list. Even if a nick is provided the MUC service MUST NOT save a nick
with the domain:

**Listing 119: Admin Grants Membership**

```xml
<iq from='crone1@shakespeare.lit/desktop'
    id='member2'
    to='coven@chat.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='member'
          jid='hamlet.lit'/>
  </query>
</iq>
```

The `<reason/>` element is OPTIONAL.

**Listing 120: Admin Grants Membership (With a Reason)**

```xml
<iq from='crone1@shakespeare.lit/desktop'
    id='member2'
    to='coven@chat.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='member'
          jid='hamlet.lit'>
      <reason>A worthy witch indeed!</reason>
    </item>
  </query>
</iq>
```

The service MUST add the domain to the member list and then inform the admin of success:

**Listing 121: Service Informs Admin of Success**

```xml
<iq from='coven@chat.shakespeare.lit'
    id='member2'
    to='crone1@shakespeare.lit/desktop'
    type='result'/>
```

If a user of the service is in the room, the MUC service MUST then send updated presence from this individual to all occupants, indicating the granting of membership by including an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value of "member".

**Listing 122: Service Sends Notice of Membership to All Occupants**

```xml
<presence
    from='coven@chat.shakespeare.lit/thirdwitch'
    .../>
```
Additionally the service MAY send a message from the room itself to the room occupants, indicating the granting of membership by including an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'affiliation' attribute set to a value of "member".

Listing 123: Service Sends Notice of Membership to All Occupants

9.6 Revoking Membership

An admin may want to revoke an entity’s membership; this is done by changing the entity’s affiliation to "none":

Listing 124: Admin Revokes Membership

The <reason/> element is OPTIONAL.
Listing 125: Admin Revokes Membership (With a Reason)

```xml
<iq from='cronel@shakespeare.lit/desktop'
    id='member2'
    to='coven@chat.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='none' jid='hag66@shakespeare.lit'>
      <reason>Not so worthy after all!</reason>
    </item>
  </query>
</iq>
```

The service MUST remove the entity from the member list and then inform the moderator of success:

Listing 126: Service Informs Moderator of Success

```xml
<iq from='coven@chat.shakespeare.lit'
    id='member2'
    to='cronel@shakespeare.lit/desktop'
    type='result'/>
```

The service MUST then send updated presence from all affected individuals to all occupants, indicating the loss of membership by sending a presence element that contains an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value of "none".

Listing 127: Service Notes Loss of Membership

```xml
<presence
  from='coven@chat.shakespeare.lit/thirdwitch'
  to='cronel@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='none' jid='hag66@shakespeare.lit/pda'
                    role='participant'/>
  </x>
</presence>
```

If the room is members-only, the service MUST remove the affected entities from the room, including a status code of 321 to indicate that the entity was removed because of an affiliation change, and inform all remaining occupants:

Listing 128: Service Removes Non-Member

```xml
[ ... ]
```
9.7 Modifying the Member List

In the context of a members-only room, the member list is essentially a “whitelist” of people who are allowed to enter the room. Anyone who is not a member is effectively banned from entering the room, even if their affiliation is not “outcast”. In the context of an open room, the member list is simply a list of entities (bare or full JID and reserved nick, or domain) who are registered with the room. Such entities may appear in a room roster, have their room nickname reserved, be returned in search results or FAQ queries, and the like.

It is RECOMMENDED that only room admins have the privilege to modify the member list in members-only rooms. To do so, the admin first requests the member list by querying the room for all users with an affiliation of ”member“:

```
Listing 129: Admin Requests Member List

<iq from='crone1@shakespeare.lit/desktop'
    id='member3'
    to='coven@chat.shakespeare.lit'
    type='get'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='member'/>
  </query>
</iq>
```
Note: A service SHOULD also return the member list to any occupant in a members-only room; i.e., it SHOULD NOT generate a <forbidden/> error when a member in the room requests the member list. This functionality may assist clients in showing all the existing members even if some of them are not in the room, e.g. to help a member determine if another user should be invited. A service SHOULD also allow any member to retrieve the member list even if not yet an occupant.

The service MUST then return the full member list to the admin qualified by the 'http://jabber.org/protocol/muc#admin' namespace; each item MUST include the 'affiliation' and 'jid' attributes and MAY include the 'nick' and 'role' attributes for each members that is currently an occupant.

Listing 130: Service Sends Member List to Admin

```xml
<iq from='coven@chat.shakespeare.lit' id='member3'
    to='crone1@shakespeare.lit/desktop'
    type='result'>
    <query xmlns='http://jabber.org/protocol/muc#admin'>
        <item affiliation='member'
                jid='hag66@shakespeare.lit'
                nick='thirdwitch'
                role='participant'/>
    </query>
</iq>
```

The admin MAY then modify the member list. In order to do so, the admin MUST send the changed items (i.e., only the "delta") to the service; each item MUST include the 'affiliation' attribute (normally set to a value of "member" or "none") and 'jid' attribute but SHOULD NOT include the 'nick' attribute and MUST NOT include the 'role' attribute (which is used to manage roles such as participant rather than the member affiliation):

Listing 131: Admin Sends Modified Member List to Service

```xml
<iq from='crone1@shakespeare.lit/desktop' id='member4'
    to='coven@chat.shakespeare.lit'
    type='set'>
    <query xmlns='http://jabber.org/protocol/muc#admin'>
        <item affiliation='none'
                jid='hag66@shakespeare.lit'/>
        <item affiliation='member'
                jid='hecate@shakespeare.lit'/>
    </query>
</iq>
```
The service MUST modify the member list and then inform the moderator of success:

Listing 132: Service Informs Moderator of Success

```xml
<iq from='coven@chat.shakespeare.lit'
   id='member4'
   to='crone1@shakespeare.lit/desktop'
   type='result'/>
```

The service MUST change the affiliation of any affected user. If the user has been removed from the member list, the service MUST change the user’s affiliation from "member" to "none". If the user has been added to the member list, the service MUST change the user’s affiliation to "member".

If a removed member is currently in a members-only room, the service SHOULD kick the occupant by changing the removed member’s role to "none" and send appropriate presence to the removed member as previously described. No matter whether the removed member was in or out of a members-only room, the service MUST subsequently refuse entry to the user.

For all room types, the service MUST send updated presence from this individual to all occupants, indicating the change in affiliation by including an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'affiliation' attribute set to a value of "none".

Listing 133: Service Sends Notice of Loss of Membership to All Occupants

```xml
<presence
   from='coven@chat.shakespeare.lit/thirdwitch'
   to='crone1@shakespeare.lit/desktop'>
   <x xmlns='http://jabber.org/protocol/muc#user'>
   <item affiliation='none'
          jid='hag66@shakespeare.lit/pda'
          role='participant'/>
   </x>
</presence>
```

In addition, the service SHOULD send an invitation to any user who has been added to the member list of a members-only room if the user is not currently affiliated with the room, for example as an admin or owner (such a user would by definition not be in the room; note also that this example includes a password but not a reason -- both child elements are OPTIONAL):

Listing 134: Room Sends Invitation to New Member

```xml
<message
   from='coven@chat.shakespeare.lit'
   to='hecate@shakespeare.lit'>
```
While only admins and owners SHOULD be allowed to modify the member list, an implementation MAY provide a configuration option that opens invitation privileges to any member of a members-only room. In such a situation, any invitation sent SHOULD automatically trigger the addition of the invitee to the member list. However, if invitation privileges are restricted to admins and a mere member attempts to send an invitation, the service MUST deny the invitation request and return a <forbidden/> error to the sender:

Listing 135: Service Returns Error on Attempt by Mere Member to Invite Others to a Members-Only Room

Invitations sent through an open room MUST NOT trigger the addition of the invitee to the member list.

If a user is added to the member list of an open room and the user is in the room, the service MUST send updated presence from this individual to all occupants, indicating the change in affiliation by including an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'affiliation' attribute set to a value of "member".

Listing 136: Service Sends Notice of Membership to All Occupants
9.8 Granting Moderator Privileges

An admin may want to grant moderator privileges to a participant or visitor; this is done by changing the user’s role to "moderator":

Listing 137: Admin Grants Moderator Privileges

```
<iq from='crone1@shakespeare.lit/desktop'
     id='mod1'
     to='coven@chat.shakespeare.lit'
     type='set'>
   <query xmlns='http://jabber.org/protocol/muc#admin'>
     <item nick='thirdwitch'
           role='moderator'/>
   </query>
</iq>
```

The <reason/> element is OPTIONAL.

Listing 138: Admin Grants Moderator Privileges (With a Reason)

```
<iq from='crone1@shakespeare.lit/desktop'
     id='mod1'
     to='coven@chat.shakespeare.lit'
     type='set'>
   <query xmlns='http://jabber.org/protocol/muc#admin'>
     <item nick='thirdwitch'
           role='moderator'>
       <reason>A worthy witch indeed!</reason>
     </item>
   </query>
</iq>
```

The service MUST add the user to the moderator list and then inform the admin of success:

Listing 139: Service Informs Admin of Success

```
<iq from='coven@chat.shakespeare.lit'
     id='mod1'
     to='crone1@shakespeare.lit/desktop'
     type='result'/>
```
The service MUST then send updated presence from this individual to all occupants, indicating the addition of moderator privileges by including an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'role' attribute set to a value of "moderator".

Listing 140: Service Sends Notice of Moderator Privileges to All Occupants

```xml
<presence
    from='coven@chat.shakespeare.lit/thirdwitch'
    to='crone1@shakespeare.lit/desktop'>
<x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member'
        jid='hag66@shakespeare.lit/pda'
        role='moderator'/>
</x>
</presence>

[ ... ]
```

9.9 Revoking Moderator Privileges

An admin may want to revoke a user's moderator privileges. An admin MAY revoke moderator privileges only from a user whose affiliation is "member" or "none" (i.e., not from an owner or admin). The privilege is revoked by changing the user's role to "participant":

Listing 141: Admin Revokes Moderator Privileges

```xml
<iq from='crone1@shakespeare.lit/desktop'
    id='mod2'
    to='coven@chat.shakespeare.lit'
    type='set'>
    <query xmlns='http://jabber.org/protocol/muc#admin'>
        <item nick='thirdwitch'
            role='participant'/>
    </query>
</iq>
```

The <reason/> element is OPTIONAL.

Listing 142: Admin Revokes Moderator Privileges (With a Reason)

```xml
<iq from='crone1@shakespeare.lit/desktop'
    id='mod2'
    to='coven@chat.shakespeare.lit'
    type='set'>
    <query xmlns='http://jabber.org/protocol/muc#admin'>
        <item nick='thirdwitch'
            reason='Reason'/>
    </query>
</iq>
```
role='participant'>
  <reason>Not so worthy after all!</reason>
</item>
</query>
</iq>

The service MUST remove the user from the moderator list and then inform the admin of success:

Listing 143: Service Informs Admin of Success

```xml
<iq from='coven@chat.shakespeare.lit'
    id='mod2'
    to='crone1@shakespeare.lit/desktop'
    type='result'/>
```

The service MUST then send updated presence from this individual to all occupants, indicating the removal of moderator privileges by sending a presence element that contains an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'role' attribute set to a value of 'participant'.

Listing 144: Service Notes Loss of Moderator Privileges

```xml
<presence
  from='coven@chat.shakespeare.lit/thirdwitch'
  to='crone1@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member' jid='hag66@shakespeare.lit/pda'
        role='participant'/>
  </x>
</presence>
```

As noted, an admin MUST NOT be allowed to revoke moderator privileges from a user whose affiliation is "owner" or "admin". If an admin attempts to revoke moderator privileges from such a user, the service MUST deny the request and return a <not-allowed/> error to the sender:

Listing 145: Service Returns Error on Attempt to Revoke Moderator Privileges from an Admin or Owner

```xml
<iq from='coven@chat.shakespeare.lit'
    id='modtest'
    to='crone1@shakespeare.lit/desktop'
    type='error'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
9.10 Modifying the Moderator List

An admin may want to modify the moderator list. To do so, the admin first requests the moderator list by querying the room for all users with a role of ‘moderator’.

Listing 146: Admin Requests Moderator List

```xml
<iq from='crone1@shakespeare.lit/desktop' id='mod3'
     to='coven@chat.shakespeare.lit'
     type='get'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item role='moderator'/>
  </query>
</iq>
```

The service MUST then return the moderator list to the admin; each item MUST include the 'jid', 'nick', and 'role' attributes and SHOULD include the 'affiliation' attribute:

Listing 147: Service Sends Moderator List to Admin

```xml
<iq from='coven@chat.shakespeare.lit'
     id='mod3'
     to='crone1@shakespeare.lit/desktop'
     type='result'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='member'
           jid='hag66@shakespeare.lit/pda'
           nick='thirdwitch'
           role='moderator'/>
  </query>
</iq>
```

The admin MAY then modify the moderator list. In order to do so, the admin MUST send the changed items (i.e., only the "delta") back to the service; each item MUST include the 'jid' attribute and 'role' attribute (normally set to a value of "member" or "participant") but SHOULD NOT include the 'nick' attribute and MUST NOT include the 'affiliation' attribute (which is used to manage affiliations such as admin rather than the moderator role):
Listing 148: Admin Sends Modified Moderator List to Service

```xml
<iq from='crone1@shakespeare.lit/desktop' id='mod4' to='coven@chat.shakespeare.lit' type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item jid='hag66@shakespeare.lit/pda'
          role='participant'/>
    <item jid='hecate@shakespeare.lit/broom'
          role='moderator'/>
  </query>
</iq>
```

The service MUST modify the moderator list and then inform the admin of success:

Listing 149: Service Informs Admin of Success

```xml
<iq from='coven@chat.shakespeare.lit' id='mod4' to='crone1@shakespeare.lit/desktop' type='result'/>
```

The service MUST then send updated presence for any affected individuals to all occupants, indicating the change in moderator privileges by sending the appropriate extended presence stanzas as described in the foregoing use cases.

As noted, moderator privileges cannot be revoked from a room owner or room admin. If a room admin attempts to revoke moderator privileges from such a user by modifying the moderator list, the service MUST deny the request and return a <not-allowed/> error to the sender:

Listing 150: Service Returns Error on Attempt to Revoke Moderator Privileges from an Admin or Owner

```xml
<iq from='coven@chat.shakespeare.lit' id='modtest' to='hag66@shakespeare.lit/pda' type='error'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item jid='hecate@shakespeare.lit/broom'
          nick='Hecate'
          role='participant'/>
  </query>
  <error type='cancel'>
    <not-allowed xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</iq>
```
9.11 Approving Registration Requests

If a service does not automatically accept requests to register with a room, it MAY provide a way for room admins to approve or deny registration requests over XMPP (alternatively, it could provide a web interface or some other admin tool). The simplest way to do so is for the service to send a <message/> stanza to the room admin(s) when the registration request is received, where the <message/> stanza contains a Data Form asking for approval or denial of the request. The following Data Form is RECOMMENDED but implementations MAY use a different form entirely, or supplement the following form with additional fields.

Listing 151: Registration Request Approval Form

```xml
<message from='coven@chat.shakespeare.lit'
    id='approve' 
    to='crone1@shakespeare.lit/pda'>
    <x xmlns='jabber:x:data' type='form'>
        <title>Registration request</title>
        <instructions>
            To approve this registration request, select the 
            &quot;Allow this person to register with the room?&quot;
            checkbox and click OK. To skip this request, click the 
            cancel button.
        </instructions>
        <field var='FORM_TYPE' type='hidden'>
            <value>http://jabber.org/protocol/muc#register</value>
        </field>
        <field var='muc#register_first' 
            type='text-single' 
            label='Given_Name'>
            <value>Brunhilde</value>
        </field>
        <field var='muc#register_last' 
            type='text-single' 
            label='Family_Name'>
            <value>Entwhistle-Throckmorton</value>
        </field>
        <field var='muc#register_roomnick' 
            type='text-single' 
            label='Desired_Nickname'>
            <value>thirdwitch</value>
        </field>
        <field var='muc#register_url' 
            type='text-single' 
            label='User_URL'>
            <value>http://witchesonline/~hag66</value>
        </field>
        <field var='muc#register_email' 
            type='text-single' 
            label='Email_Address'>
```
If the admin approves the registration request, the service shall register the user with the room. More advanced registration approval mechanisms (e.g., retrieving a list of registration requests using Ad-Hoc Commands\(^\text{20}\) as is done in Publish-Subscribe\(^\text{21}\)) are out of scope for this document.

10 Owner Use Cases

Every room MUST have at least one owner, and that owner (or a successor) is a long-lived attribute of the room for as long as the room exists (e.g., the owner does not lose ownership on exiting a persistent room). This document assumes that the (initial) room owner is the individual who creates the room and that only a room owner has the right to change defining room configuration settings such as the room type. Ideally, room owners will be able to specify not only the room types (password-protected, members-only, etc.) but also certain attributes of the room as listed in the Requirements section of this document. In addition, it would be good if an owner were able to specify the JIDs of other owners, but that shall be determined by the implementation.

In order to provide the necessary flexibility for a wide range of configuration options, Data Forms (XEP-0004) shall be used for room configuration, triggered by use of the 'http://jabber.org/protocol/muc' namespace. That is, if an entity does not include the MUC namespace in its room join/create request, then the service shall create the room and not wait for configuration via Data Forms before creating the room (this ensures backwards-compatibility with the old "groupchat 1.0" protocol); however, if the room join/create request includes the MUC extension, then the service shall require configuration via Data Forms before creating and unlocking the room.

Note: The configuration options shown below address all of the features and room types listed in the requirements section of this document; however, the exact configuration options and

form layout shall be determined by the implementation or specific deployment. Also, these are examples only and are not intended to define the only allowed or required configuration options for rooms. A given implementation or deployment MAY choose to provide additional configuration options (profanity filters, setting the default language for a room, message logging, etc.), which is why the use of the 'jabber:x:data' protocol is valuable here.

10.1 Creating a Room

10.1.1 General Considerations

The privilege to create rooms MAY be restricted to certain users or MAY be reserved to an administrator of the service. If access is restricted and a user attempts to create a room, the service MUST return a <not-allowed/> error:

```
Listing 152: Service Informs User of Inability to Create a Room

<presence
    from='coven@chat.shakespeare.lit/thirdwitch'
    to='hag66@shakespeare.lit/pda'
    type='error'>

<x xmlns='http://jabber.org/protocol/muc'/>
<error type='cancel'>
   <not-allowed
        xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
</error>
</presence>
```

If access is not restricted, the service MUST allow the user to create a room as described below. From the perspective of room creation, there are in essence two kinds of rooms:

- "Instant rooms" -- these are available for immediate access and are automatically created based on some default configuration.

- "Reserved rooms" -- these are manually configured by the room creator before anyone is allowed to enter.

The workflow for creating and configuring such rooms is as follows:

1. The user MUST send presence to <room@service/nick> and signal his or her support for the Multi-User Chat protocol by including extended presence information in an empty <x/> child element qualified by the 'http://jabber.org/protocol/muc' namespace (note the lack of an '#owner' or '#user' fragment).
2. If this user is allowed to create a room and the room does not yet exist, the service MUST create the room according to some default configuration, assign the requesting user as the initial room owner, and add the owner to the room but not allow anyone else to enter the room (effectively “locking” the room). The initial presence stanza received by the owner from the room MUST include extended presence information indicating the user’s status as an owner and acknowledging that the room has been created (via status code 201) and is awaiting configuration.

3. If the initial room owner would like to create and configure a reserved room, the room owner MUST then request a configuration form by sending an IQ stanza of type "get" to the room containing an empty <query/> element qualified by the 'http://jabber.org/protocol/muc#owner' namespace, then complete Steps 4 and 5. If the room owner would prefer to create an instant room, the room owner MUST send a query element qualified by the 'http://jabber.org/protocol/muc#owner' namespace and containing an empty <x/> element of type "submit" qualified by the 'jabber:x:data' namespace, then skip to Step 6.

4. If the room owner requested a configuration form, the service MUST send an IQ to the room owner containing a configuration form qualified by the 'jabber:x:data' namespace. If there are no configuration options available, the room MUST return an empty query element to the room owner.

5. The initial room owner SHOULD provide a starting configuration for the room (or accept the default configuration) by sending an IQ of type "set" containing the completed configuration form. Alternatively, the room owner MAY cancel the configuration process. (An implementation MAY set a timeout for initial configuration, such that if the room owner does not configure the room within the timeout period, the room owner is assumed to have accepted the default configuration or to have cancelled the configuration process.)

6. Once the service receives the completed configuration form from the initial room owner (or receives a request for an instant room), the service MUST "unlock" the room (i.e., allow other users to enter the room) and send an IQ of type "result" to the room owner. If the service receives a cancellation, it MUST destroy the room.

The protocol for this workflow is shown in the examples below. First, the user MUST send presence to the room, including an empty <x/> element qualified by the 'http://jabber.org/protocol/muc' namespace (this is the same stanza sent when seeking to enter a room).
Listing 153: User Creates a Room and Signals Support for Multi-User Chat

```xml
<presence
  from='crone@shakespeare.lit/desktop'
  to='coven@chat.shakespeare.lit/firstwitch'>
<x xmlns='http://jabber.org/protocol/muc'/>
</presence>
```

If the room does not yet exist, the service SHOULD create the room (subject to local policies regarding room creation), assign the bare JID of the requesting user as the owner, add the owner to the room, and acknowledge successful creation of the room by sending a presence stanza of the following form:

Listing 154: Service Acknowledges Room Creation

```xml
<presence
  from='coven@chat.shakespeare.lit/firstwitch'
  to='crone@shakespeare.lit/desktop'>
<x xmlns='http://jabber.org/protocol/muc#user'>
  <item affiliation='owner'
        role='moderator'/>
  <status code='110'/>
  <status code='201'/>
</x>
</presence>
```

After receiving notification that the room has been created, the room owner needs to decide whether to accept the default room configuration (i.e., create an "instant room") or configure the room to have something other than the default room configuration (i.e., create a "reserved room"). The protocol flows for completing those two use cases are shown in the following sections.

Note: If the presence stanza sent to a nonexistent room does not include an `<x/>` element qualified by the `http://jabber/protocol/muc` namespace as shown above, the service SHOULD create a default room without delay (i.e., it MUST assume that the client supports "groupchat 1.0" rather than Multi-User Chat and therefore it MUST NOT lock the room while waiting for the room creator to either accept an instant room or configure a reserved room).

### 10.1.2 Creating an Instant Room

If the initial room owner wants to accept the default room configuration (i.e., create an "instant room"), the room owner MUST decline an initial configuration form by sending an IQ set to the `<room@service>` itself containing a `<query/>` element qualified by the `http://jabber.org/protocol/muc#owner` namespace, where the only child of the `<query/>` is an empty `<x/>` element that is qualified by the 'jabber:x:data' namespace and that possesses a 'type' attribute whose value is "submit":

```xml
<iq type='set'
    from='crone@shakespeare.lit/desktop'
    to='coven@chat.shakespeare.lit/firstwitch'>
  <query xmlns='http://jabber.org/protocol/muc#owner'>
    <x xmlns='jabber:x:data'>
      <field var='forminds'
        type='submit'/>
    </x>
  </query>
</iq>
```
10.1.3 Creating a Reserved Room

If the initial room owner wants to create and configure a reserved room, the room owner MUST request an initial configuration form by sending an IQ get to the <room@service> itself containing an empty <query/> element qualified by the 'http://jabber.org/protocol/muc#owner' namespace:

Listing 156: Owner Requests Configuration Form

```
<iq from='cronel@shakespeare.lit/desktop'
    id='create1'
    to='coven@chat.shakespeare.lit'
    type='get'>
  <query xmlns='http://jabber.org/protocol/muc#owner'/>
</iq>
```

If the room does not already exist, the service MUST return an initial room configuration form to the user. (Note: The following example shows a representative sample of configuration options. A full list of x:data fields registered for use in room creation and configuration is maintained by the XMPP Registrar; see the XMPP Registrar Considerations section of this document.)

Listing 157: Service Sends Configuration Form

```
<iq from='coven@chat.shakespeare.lit'
    id='create1'
    to='cronel@shakespeare.lit/desktop'
    type='result'>
  <query xmlns='http://jabber.org/protocol/muc#owner'>
    <x xmlns='jabber:x:data' type='form'>
      <title>Configuration for "coven" Room</title>
      <instructions>
        Your room coven@macbeth has been created!
        The default configuration is as follows:
      </instructions>
  </x>
</iq>
```
- No logging
- No moderation
- Up to 20 occupants
- No password required
- No invitation required
- Room is not persistent
- Only admins may change the subject
- Presence broadcasted for all users

To accept the default configuration, click OK. To select a different configuration, please complete this form.

</instructions>

<field type='hidden'

  var='muc#roomconfig_whois'>
  <option label='Moderators_Only'>
    <value>moderators</value>
  </option>
  <option label='Anyone'>
    <value>anyone</value>
  </option>
</field>

$field type='fixed'>
  <value>
  You may specify additional people who have
  administrative privileges in the room. Please
  provide one jabber ID per line.
  </value></field>

$field
  label='Room_Amins'
  type='jid-multi'
  var='muc#roomconfig_roomadmins'/>

$field type='fixed'>
  <value>
You may specify additional owners for this room. Please provide one Jabber ID per line.
</value>
</field>
</query>
</iq>

Note: The _whois configuration option specifies whether the room is non-anonymous (a value of "anyone"), semi-anonymous (a value of "moderators"), or fully anonymous (a value of "none", not shown here).
If there are no configuration options available, the service MUST return an empty query element to the room owner:

Listing 158: Service Informs Owner that No Configuration is Possible

```xml
<iq from='coven@chat.shakespeare.lit'
    id='create1'
    to='cronel@shakespeare.lit/desktop'
    type='result'>
    <query xmlns='http://jabber.org/protocol/muc#owner'/>
</iq>
```

The room owner SHOULD then fill out the form and submit it to the service.

Listing 159: Owner Submits Configuration Form

```xml
<iq from='cronel@shakespeare.lit/desktop'
    id='create2'
    to='coven@chat.shakespeare.lit'
    type='set'>
    <query xmlns='http://jabber.org/protocol/muc#owner'>
        <x xmlns='jabber:x:data' type='submit'>
            <field var='FORM_TYPE'>
                <value>http://jabber.org/protocol/muc#roomconfig</value>
            </field>
        </x>
    </query>
    <field var='muc#roomconfig_roomname'>
        <value>A Dark Cave</value>
    </field>
    <field var='muc#roomconfig_roomdesc'>
        <value>The place for all good witches!</value>
    </field>
    <field var='muc#roomconfig_enablelogging'>
        <value>0</value>
    </field>
</iq>
```
If room creation is successful, the service MUST inform the new room owner of success:

Listing 160: Service Informs New Room Owner of Success

```xml
<iq from='coven@chat.shakespeare.lit' id='create2' to='crone1@shakespeare.lit/desktop' type='result'/>
```

If the room creation fails because the specified room configuration options violate one or more service policies (e.g., because the password for a password-protected room is blank), the
service MUST return a <not-acceptable/> error.

Listing 161: Service Informs Owner that Requested Configuration Options Are Unacceptable

```
<iq from='coven@chat.shakespeare.lit'
    id='create2'
    to='crone1@shakespeare.lit/desktop'
    type='error'>
  <error type='modify'>
    <not-acceptable xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</iq>
```

Alternatively, the room owner MAY cancel the configuration process:

Listing 162: Owner Cancels Initial Configuration

```
<iq from='crone1@shakespeare.lit/desktop'
    id='create2'
    to='coven@chat.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#owner'>
    <x xmlns='jabber:x:data' type='cancel'/>
  </query>
</iq>
```

If the room owner cancels the initial configuration, the service SHOULD destroy the room, making sure to send unavailable presence to the room owner (see the “Destroying a Room” use case for protocol details).

If the room owner becomes unavailable for any reason before submitting the form (e.g., a lost connection), the service will receive a presence stanza of type "unavailable" from the owner to the owner's <room@service/nick> or to <room@service> (or both). The service MUST then destroy the room, sending a presence stanza of type "unavailable" from the room to the owner including a <destroy/> element and reason (if provided) as defined in the Destroying a Room section of this document.

10.1.4 Requesting a Unique Room Name

In some situations (e.g., when Converting a One-to-One Chat Into a Conference), the room creator may want to request a unique room name before attempting to create the room (e.g., to avoid the possibility of a room conflict). In order to facilitate this, a service MAY support the feature described in this section. (If a service does support this feature, it MUST return a feature of "http://jabber.org/protocol/muc#unique" in its response to service discovery information requests.)

The room creator requests a unique room name by sending an IQ-get to the service itself, containing an empty <unique/> element qualified by the
'http://jabber.org/protocol/muc#unique' namespace:

Listing 163: Entity Requests Unique Room Name

```xml
<iq from='crone1@shakespeare.lit/desktop'
     id='unique1'
     to='chat.shakespeare.lit'
     type='get'>
  <unique xmlns='http://jabber.org/protocol/muc#unique'/>
</iq>
```

If the service supports this feature, it SHOULD return a unique room name as the XML character data of the <unique/> element (but not create the room):

Listing 164: Service Returns Unique Room Name

```xml
<iq from='chat.shakespeare.lit'
     id='unique1'
     to='crone1@shakespeare.lit/desktop'
     type='result'>
  <unique xmlns='http://jabber.org/protocol/muc#unique'>6d9423a55f499b29ad20bf7b2bdea4f4b885ead1</unique>
</iq>
```

The service MAY refuse to return a unique room name to entities that are not entitled to create rooms, entities that have sent an excessive number of requests for unique room names, etc.

The service MAY use any algorithm that ensures the creation of a room name that will be permanently unique in the context of the service (e.g., a SHA-1 hash of the requesting JID, datetime, and random salt).

The room creator would then use the XML character data of the <unique/> element as the node identifier portion of the room JID it requests:

Listing 165: Owner Creates Room With Unique Name

```xml
<presence
   from='crone1@shakespeare.lit/desktop'
   to='6d9423a55f499b29ad20bf7b2bdea4f4b885ead1@chat.shakespeare.lit/firstswitch'>
  <x xmlns='http://jabber.org/protocol/muc'/>
</presence>
```

10.2 Subsequent Room Configuration

At any time after specifying the initial configuration of the room, a room owner may want to change the configuration. In order to initiate this process, a room owner MUST request a new
configuration form from the room by sending an IQ to `<room@service>` containing an empty `<query/>` element qualified by the 'http://jabber.org/protocol/muc#owner' namespace.

Listing 166: Owner Requests Configuration Form

```
<iq from='crone1@shakespeare.lit/desktop'
    id='config1'
    to='coven@chat.shakespeare.lit'
    type='get'>
    <query xmlns='http://jabber.org/protocol/muc#owner'/>
</iq>
```

If the `<user@host>` of the 'from' address does not match the bare JID of a room owner, the service MUST return a `<forbidden/>` error to the sender:

Listing 167: Service Denies Configuration Access to Non-Owner

```
<iq from='coven@chat.shakespeare.lit'
    id='configures'
    to='wiccarocks@shakespeare.lit/laptop'
    type='error'>
    <query xmlns='http://jabber.org/protocol/muc#owner'/>
    <error type='auth'>
        <forbidden xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
    </error>
</iq>
```

Otherwise, the service MUST send a configuration form to the room owner with the current options set as defaults:

Listing 168: Service Sends Configuration Form to Owner

```
<iq from='coven@chat.shakespeare.lit'
    id='config'
    to='crone1@shakespeare.lit/desktop'
    type='result'>
    <query xmlns='http://jabber.org/protocol/muc#owner'>
        <x xmlns='jabber:x:data' type='form'>
            <title>Configuration for "coven" Room</title>
            <instructions>
                Complete this form to make changes to the configuration of your room.
            </instructions>
            <field
                type='hidden'
                var='FORM_TYPE'>
                <value>http://jabber.org/protocol/muc#roomconfig</value>
            </field>
        </x>
    </query>
</iq>
```

    type='jid-multi'
    var='muc#roomconfig_roomadmins'>
    <value>wiccarocks@shakespeare.lit</value>
    <value>hecate@shakespeare.lit</value>
</field>

<field type='fixed'>
    <value>
        You may specify additional owners for this room. Please provide one Jabber ID per line.
    </value>
</field>

<field
    label='Room_Owners'
    type='jid-multi'
    var='muc#roomconfig_roomowners'/>
If there are no configuration options available, the service MUST return an empty query element to the room owner as shown in the previous use case. The room owner SHOULD then submit the form with updated configuration information. Alternatively, the room owner MAY cancel the configuration process.

Listing 169: Owner Cancels Subsequent Configuration

```xml
<iq from='crone1@shakespeare.lit/desktop'
    id='config2'
    to='coven@chat.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#owner'>
    <x xmlns='jabber:x:data' type='cancel'/>
  </query>
</iq>
```

If the room owner cancels the subsequent configuration, the service MUST leave the configuration of the room as it was before the room owner initiated the subsequent configuration process.

If as a result of a change in the room configuration a room admin loses administrative privileges while the admin is in the room, the room MUST send updated presence for that individual to all occupants, denoting the change in status by including an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value of "member" and the 'role' attribute set to a value of "participant" or "visitor" as appropriate for the affiliation level and the room type:

Listing 170: Service Notes Loss of Admin Affiliation

```xml
<presence>
  <from>'coven@chat.shakespeare.lit/secondwitch'</from>
  <to>'crone1@shakespeare.lit/desktop'</to>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member'
          jid='wiccarocks@shakespeare.lit/laptop'
          role='participant'/>'
  </x>
</presence>
```

If as a result of a change in the room configuration a user gains administrative privileges while the user is in the room, the room MUST send updated presence for that individual to all occupants, denoting the change in status by including an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value of "admin" and the 'role' attribute set to a value of "admin":

```xml
<presence>
  <from>'coven@chat.shakespeare.lit/secondwitch'</from>
  <to>'crone1@shakespeare.lit/desktop'</to>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='admin'
          jid='wiccarocks@shakespeare.lit/laptop'
          role='admin'/>
  </x>
</presence>
```
Listing 171: Service Notes Gain of Admin Affiliation to All Users

```xml
<presence
    from='coven@chat.shakespeare.lit/secondwitch'
    to='crone1@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='admin'
          jid='wiccarocks@shakespeare.lit/laptop'
          role='moderator'/>
  </x>
</presence>
[ ... ]
```

If as a result of a change in the room configuration a room owner loses owner privileges while that owner is in the room, the room MUST send updated presence for that individual to all occupants, denoting the change in status by including an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value of "admin" and the 'role' attribute set to an appropriate value given the affiliation and room type ("moderator" is recommended).

Listing 172: Service Notes Loss of Owner Affiliation

```xml
<presence
    from='coven@chat.shakespeare.lit/secondwitch'
    to='crone1@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='admin'
          jid='wiccarocks@shakespeare.lit/laptop'
          role='moderator'/>
  </x>
</presence>
[ ... ]
```

A service MUST NOT allow an owner to revoke his or her own ownership privileges if there are no other owners; if an owner attempts to do this, the service MUST return a `<conflict/>` error to the owner. However, a service SHOULD allow an owner to revoke his or her own ownership privileges if there are other owners. I.e. a service MUST NOT allow the owner list to become empty.

If as a result of a change in the room configuration a user gains ownership privileges while the user is in the room, the room MUST send updated presence for that individual to all occupants, denoting the change in status by including an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value of "owner" and the 'role' attribute set to an appropriate value given the affiliation and room type ("moderator" is recommended).
Listing 173: Service Notes Gain of Owner Affiliation to All Users

```xml
<presence>
  <from>'coven@chat.shakespeare.lit/secondwitch'</from>
  <to>'crone1@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='owner'
      jid='wiccarocks@shakespeare.lit/laptop'
      role='moderator'/>  
  </x>
</presence>

[ ... ]
```

If as a result of a change in the room configuration the room type is changed to members-only but there are non-members in the room, the service MUST remove any non-members from the room and include a status code of 322 in the presence unavailable stanzas sent to those users as well as any remaining occupants.

### 10.2.1 Notification of Configuration Changes

A room MUST send notification to all occupants when the room configuration changes in a way that has an impact on the privacy or security profile of the room. This notification shall consist of a `<message/>` stanza containing an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace, which shall contain only a `<status/>` element with an appropriate value for the 'code' attribute. Here is an example:

Listing 174: Configuration Status Code

```xml
<message from='coven@chat.shakespeare.lit' to='crone1@shakespeare.lit/desktop'
  type='groupchat'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <status code='170'/>
  </x>
</message>
```

The codes to be generated as a result of a privacy-related change in room configuration are as follows:

- If room logging is now enabled, status code 170.
- If room logging is now disabled, status code 171.
- If the room is now non-anonymous, status code 172.
- If the room is now semi-anonymous, status code 173.
If the room is now fully-anonymous, status code 174.

For any other configuration change, the room SHOULD send status code 104 so that interested occupants can retrieve the updated room configuration if desired.

10.3 Granting Ownership Privileges to a User

If allowed by an implementation, an owner MAY grant ownership privileges to another user; this is done by changing the user’s affiliation to "owner":

Listing 175: Owner Grants Ownership Privileges

```xml
<iq from='crone1@shakespeare.lit/desktop'
    id='owner1'
    to='coven@chat.shakespeare.lit'
    type='set'>
    <query xmlns='http://jabber.org/protocol/muc#admin'>
        <item affiliation='owner'
              jid='hecate@shakespeare.lit'/>
    </query>
</iq>
```

The `<reason/>` element is OPTIONAL.

Listing 176: Owner Grants Ownership Privileges (With a Reason)

```xml
<iq from='crone1@shakespeare.lit/desktop'
    id='owner1'
    to='coven@chat.shakespeare.lit'
    type='set'>
    <query xmlns='http://jabber.org/protocol/muc#admin'>
        <item affiliation='owner'
              jid='hecate@shakespeare.lit'>
            <reason>A worthy witch indeed!</reason>
        </item>
    </query>
</iq>
```

The service MUST add the user to the owner list and then inform the owner of success:

Listing 177: Service Informs Owner of Success

```xml
<iq from='coven@chat.shakespeare.lit'
    id='owner1'
    to='crone1@shakespeare.lit/desktop'
    type='result'/>
```
If the user is in the room, the service MUST then send updated presence from this individual to all occupants, indicating the granting of ownership privileges by including an `<x>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value of "owner" and the 'role' attribute set to an appropriate value given the affiliation and room type ("moderator" is recommended).

Listing 178: Service Sends Notice of Ownership Privileges to All Occupants

```xml
<presence
    from='coven@chat.shakespeare.lit/hecate'
    to='cronel@shakespeare.lit/desktop'>
<x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='owner'
        jid='hecate@shakespeare.lit'
        role='moderator'/>   
</x>
</presence>

[ ... ]
```

If the user is not in the room, the service MAY send a message from the room itself to the room occupants, indicating the granting of ownership privileges by including an `<x>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value of "owner".

Listing 179: Service Sends Notice of Ownership Privileges to All Occupants

```xml
<message
    from='chat.shakespeare.lit'
    to='cronel@shakespeare.lit/desktop'>
<x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member'
        jid='hecate@shakespeare.lit'
        role='none'/>   
</x>
</message>

[ ... ]
```

10.4 Granting Ownership Privileges to a Service

If allowed by an implementation, an owner MAY grant ownership privileges all users of a service; this is done by adding the service’s domain to the owner list:

Listing 180: Owner Grants Ownership Privileges

```xml
<iq from='cronel@shakespeare.lit/desktop'...
```
The <reason/> element is OPTIONAL.

Listing 181: Owner Grants Ownership Privileges (With a Reason)

```xml
<iq from='crone1@shakespeare.lit/desktop'
   id='owner2'
   to='coven@chat.shakespeare.lit'
   type='set'>
   <query xmlns='http://jabber.org/protocol/muc#admin'>
     <item affiliation='owner'
           jid='hamlet.lit'/>
   </query>
</iq>
```

The service MUST add the domain to the owner list and then inform the owner of success:

Listing 182: Service Informs Owner of Success

```xml
<iq from='coven@chat.shakespeare.lit'
    id='owner2'
    to='crone1@shakespeare.lit/desktop'
    type='result'/>
```

If an affected user is in the room, the service MUST then send updated presence from this individual to all occupants, indicating the granting of ownership privileges by including an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'affiliation' attribute set to a value of "owner" and the 'role' attribute set to an appropriate value given the affiliation and room type ("moderator" is recommended).

Listing 183: Service Sends Notice of Ownership Privileges to All Occupants

```xml
<presence
   from='coven@chat.shakespeare.lit/hecate'
   to='crone1@shakespeare.lit/desktop'>
   <x xmlns='http://jabber.org/protocol/muc#user'>
     <item affiliation='owner'
```
jid='claudius@hamlet.lit'
  role='moderator'/>
</x>
</presence>
[ ... ]

The service MAY send a message from the room itself to the room occupants, indicating the granting of ownership privileges by including an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'affiliation' attribute set to a value of "owner".

Listing 184: Service Sends Notice of Ownership Privileges to All Occupants

```xml
<message
  from='chat.shakespeare.lit'
  to='crone1@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='member'
      jid='hamlet.lit'
      role='none'/>
  </x>
</message>
[ ... ]
```

10.5 Revoking Ownership Privileges

An implementation MAY allow an owner to revoke an entity's ownership privileges; this is done by changing the entity's affiliation to something other than "owner":

Listing 185: Owner Revokes Ownership Privileges

```xml
<iq from='crone1@shakespeare.lit/desktop'
  id='owner2'
  to='coven@chat.shakespeare.lit'
  type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='admin'
      jid='hecate@shakespeare.lit'/>
  </query>
</iq>
```

The <reason/> element is OPTIONAL.

Listing 186: Owner Revokes Ownership Privileges (With a Reason)
A service MUST NOT allow an owner to revoke his or her own ownership privileges if there are no other owners; if an owner attempts to do this, the service MUST return a `<conflict/>` error to the owner. However, a service SHOULD allow an owner to revoke his or her own ownership privileges if there are other owners.

If an implementation does not allow one owner to revoke another user's ownership privileges, the implementation MUST return a `<not-authorized/>` error to the owner who made the request.

Note: Allowing an owner to remove another user’s ownership privileges can compromise the control model for room management; therefore this feature is OPTIONAL, and implementations are encouraged to support owner removal through an interface that is open only to individuals with service-wide administrative privileges.

In all other cases, the service MUST remove the entity from the owner list and then inform the owner of success:

**Listing 187: Service Informs Owner of Success**

```
<iq from='coven@chat.shakespeare.lit' id='owner2'
     to='coven@chat.shakespeare.lit'
     type='result'/>
```

If an affected user is in the room, the service MUST then send updated presence from this individual to all occupants, indicating the loss of ownership privileges by sending a presence element that contains an `<x/>` element qualified by the `http://jabber.org/protocol/muc#user` namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value other than "owner" and the 'role' attribute set to an appropriate value:

**Listing 188: Service Notes Loss of Owner Affiliation**

```
<presence
     from='coven@chat.shakespeare.lit/secondwitch'
     to='coven@chat.shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='admin'
           jid='hecate@shakespeare.lit'/>
  </x>
</presence>
```
If no affected user is in the room, or the entity is identified by a domain, the service MAY send a message from the room itself to the room occupants, indicating the loss of ownership privileges by including an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value other than "owner".

Listing 189: Service Notes Loss of Owner Affiliation

```xml
<message
  from='chat.shakespeare.lit'
  to='crlone1@shakespeare.lit/desktop'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='admin'
      jid='hecate@shakespeare.lit'
      role='none'/> 
  </x>
</message>
```

10.6 Modifying the Owner List

If allowed by an implementation, a room owner may want to modify the owner list. To do so, the owner first requests the owner list by querying the room for all entities with an affiliation of 'owner'.

Listing 190: Owner Requests Owner List

```xml
<iq from='bard@shakespeare.lit/globe'
    id='owner3'
    to='coven@chat.shakespeare.lit'
    type='get'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='owner'/>
  </query>
</iq>
```

If the 'from' address does not match the JID of a room owner, the service MUST return a `<forbidden/>` error to the sender. Otherwise, the service MUST then return the owner list to the owner; each item MUST include the 'affiliation' and 'jid' attributes and MAY include the 'nick' and 'role' attributes for any
owner that is currently an occupant:

**Listing 191: Service Sends Owner List to Owner**

```xml
<iq from='coven@chat.shakespeare.lit'
    id='owner3'
    to='bard@shakespeare.lit/globe'
    type='result'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='owner'
          jid='crone@shakespeare.lit'/>
  </query>
</iq>
```

The owner MAY then modify the owner list. In order to do so, the owner MUST send the changed items (i.e., only the “delta”) back to the service; each item MUST include the ‘affiliation’ and ‘jid’ attributes but SHOULD NOT include the ‘nick’ attribute and MUST NOT include the ‘role’ attribute (which is used to manage roles such as participant rather than the owner affiliation):

**Listing 192: Owner Sends Modified Owner List to Service**

```xml
<iq from='bard@shakespeare.lit/globe'
    id='owner4'
    to='coven@chat.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='owner'
          jid='hecate@shakespeare.lit'/>
  </query>
</iq>
```

Only owners shall be allowed to modify the owner list. If a non-owner attempts to view or modify the owner list, the service MUST deny the request and return a `<forbidden/>` error to the sender:

**Listing 193: Service Returns Error on Attempt by Non-Owner to Modify Owner List**

```xml
<iq from='coven@chat.shakespeare.lit'
    id='ownerertest'
    to='hag66@shakespeare.lit/pda'
    type='error'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='owner'
          jid='hecate@shakespeare.lit'/>
  </query>
</iq>
```

22 This is different from the behavior of room configuration, wherein the ‘muc#roomconfig_roomowners’ field specifies the full list of room owners, not the delta.
A service MUST NOT allow an owner to revoke his or her own ownership privileges if there are no other owners; if an owner attempts to do this, the service MUST return a <conflict/> error to the owner. However, a service SHOULD allow an owner to revoke his or her own ownership privileges if there are other owners.

In all other cases, the service MUST modify owner list and then inform the owner of success:

Listing 194: Service Informs Owner of Success

```xml
<iq from='coven@chat.shakespeare.lit' id='owner4' to='cron1@shakespeare.lit/desktop' type='result'/>
```

The service MUST also send presence notifications related to any affiliation changes that result from modifying the owner list as previously described.

### 10.7 Granting Administrative Privileges to a User

An owner can grant administrative privileges to a member or unaffiliated user; this is done by changing the user's affiliation to "admin":

Listing 195: Owner Grants Admin Privileges

```xml
<iq from='cron1@shakespeare.lit/desktop' id='admin1' to='coven@chat.shakespeare.lit' type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='admin' jid='wiccarocks@shakespeare.lit'/>
  </query>
</iq>
```

The <reason/> element is OPTIONAL.

Listing 196: Owner Grants Admin Privileges (With a Reason)

```xml
<iq from='cron1@shakespeare.lit/desktop' id='admin1' to='coven@chat.shakespeare.lit' type='set'>
```
The service MUST add the user to the admin list and then inform the owner of success:

Listing 197: Service Informs Owner of Success

```xml
<iq from='coven@chat.shakespeare.lit' id='admin'
    to='crone1@shakespeare.lit/desktop'
    type='result'/>
```

If the user is in the room, the service MUST then send updated presence from this individual to all occupants, indicating the granting of administrative privileges by including an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value of "admin" and the 'role' attribute set to an appropriate value given the affiliation and room type.

Listing 198: Service Sends Notice of Administrative Privileges to All Occupants

```xml
<presence
    from='coven@chat.shakespeare.lit/secondwitch'
    to='crone1@shakespeare.lit/desktop'>
    <x xmlns='http://jabber.org/protocol/muc#user'
        affiliation='admin'
        jid='wiccarocks@shakespeare.lit'
        role='moderator'/></x>
</presence>
```

If the user is not in the room, the service MAY send a message from the room itself to the room occupants, indicating the granting of administrative privileges by including an `<x/>` element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an `<item/>` child with the 'affiliation' attribute set to a value of "admin".

Listing 199: Service Sends Notice of Administrative Privileges to All Occupants

```xml
<message
    from='chat.shakespeare.lit'
    to='crone1@shakespeare.lit/desktop'>
    <x xmlns='http://jabber.org/protocol/muc#user'/>
```

[...]

112
10.8 Granting Administrative Privileges to all Users of a Service

An owner can grant administrative privileges to all users of a service; this is done by changing the service’s affiliation to "admin":

Listing 200: Owner Grants Admin Privileges

```xml
<iq from='crone!@shakespeare.lit/desktop'
    id='admin1'
    to='coven@chat.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='admin'
           jid='hamlet.lit'/>  
  </query>
</iq>
```

The <reason/> element is OPTIONAL.

Listing 201: Owner Grants Admin Privileges (With a Reason)

```xml
<iq from='crone!@shakespeare.lit/desktop'
    id='admin1'
    to='coven@chat.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='admin'
           jid='hamlet.lit'>  
      <reason>There is nothing either good or bad, but thinking makes it so.</reason>
    </item>
  </query>
</iq>
```

The service MUST add the service’s domain to the admin list and then inform the owner of success:

Listing 202: Service Informs Owner of Success
<iq from='coven@chat.shakespeare.lit' id='admin1' to='crone1@shakespeare.lit/desktop' type='result'/>

If an affected user is in the room, the service MUST then send updated presence from this individual to all occupants, indicating the granting of administrative privileges by including an 
<x> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item> child with the 'affiliation' attribute set to a value of "admin" and the 'role' attribute set to an appropriate value given the affiliation and room type.

Listing 203: Service Sends Notice of Administrative Privileges to All Occupants

<presence
  from='coven@chat.shakespeare.lit/secondwitch'
  to='crone1@shakespeare.lit/desktop'>
<x xmlns='http://jabber.org/protocol/muc#user'>
  <item affiliation='admin'
      jid='claudius@hamlet.lit'
      role='moderator'/>
</x>
</presence>
[ ... ]

The service MAY send a message from the room itself to the room occupants, indicating the granting of administrative privileges by including an <x> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item> child with the 'affiliation' attribute set to a value of "admin".

Listing 204: Service Sends Notice of Administrative Privileges to All Occupants

<message
  from='chat.shakespeare.lit'
  to='crone1@shakespeare.lit/desktop'>
<x xmlns='http://jabber.org/protocol/muc#user'>
  <item affiliation='admin'
      jid='hamlet.lit'
      role='none'/>
</x>
</message>
[ ... ]

10.9 Revoking Administrative Privileges

An owner may want to revoke an entity's administrative privileges; this is done by changing the entity's affiliation to something other than "admin" or "owner":

114
The <reason/> element is OPTIONAL.

The service MUST remove the entity from the admin list and then inform the owner of success:

If an affected is in the room, the service MUST then send updated presence from this individual to all occupants, indicating the loss of administrative privileges by sending a presence element that contains an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'affiliation' attribute set to a value other than "admin" or "owner" and the 'role' attribute set to an appropriate value given the affiliation level and the room type:

Listing 208: Service Notes Loss of Admin Affiliation

```xml
<presence>
</presence>
```
from='coven@chat.shakespeare.lit/secondwitch'
to='crone1@shakespeare.lit/desktop'>
<x xmlns='http://jabber.org/protocol/muc#user'>
  <item affiliation='member' jid='wiccarocks@shakespeare.lit' role='participant'/>
</x>
</presence>
[ ... ]

The service MAY send a message from the room itself to the room occupants, indicating the loss of administrative privileges by including an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child with the 'affiliation' attribute set to a value other than "admin".

Listing 209: Service Notes Loss of Admin Affiliation

10.10 Modifying the Admin List

A room owner may want to modify the admin list. To do so, the owner first requests the admin list by querying the room for all entities with an affiliation of 'admin'.

Listing 210: Owner Requests Admin List

If the 'from' address does not match the JID of a room owner, the service MUST return a <forbidden/> error to the sender.

116
Otherwise, the service MUST then return the admin list to the owner; each item MUST include the 'affiliation' and 'jid' attributes and MAY include the 'nick' and 'role' attributes for any admin that is currently an occupant:

Listing 211: Service Sends Admin List to Owner

```xml
<iq from='coven@chat.shakespeare.lit'
    id='admin3'
    to='bard@shakespeare.lit/globe'
    type='result'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='admin'
          jid='wiccarocks@shakespeare.lit'
          nick='secondwitch'/>
    <item affiliation='admin'
          jid='hag66@shakespeare.lit'/>
  </query>
</iq>
```

The owner MAY then modify the admin list. In order to do so, the owner MUST send the changed items (i.e., only the "delta") back to the service; 23 each item MUST include the 'affiliation' attribute (normally set to a value of "admin" or "none") and 'jid' attribute but SHOULD NOT include the 'nick' attribute and MUST NOT include the 'role' attribute (which is used to manage roles such as participant rather than the admin affiliation):

Listing 212: Owner Sends Modified Admin List to Service

```xml
<iq from='bard@shakespeare.lit/globe'
    id='admin4'
    to='coven@chat.shakespeare.lit'
    type='set'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='none'
          jid='hag66@shakespeare.lit'/>
    <item affiliation='admin'
          jid='hecate@shakespeare.lit'/>
  </query>
</iq>
```

Only owners shall be allowed to modify the admin list. If a non-owner attempts to view or modify the admin list, the service MUST deny the request and return a <forbidden/> error to the sender:

---

23 This is different from the behavior of room configuration, wherein the 'muc#roomconfig_roomadmins' field specifies the full list of room admins, not the delta.
Listing 213: Service Returns Error on Attempt by Non-Owner to Modify Admin List

```
<iq from='coven@chat.shakespeare.lit' id='adminintest' to='hag66@shakespeare.lit/pda' type='error'>
  <query xmlns='http://jabber.org/protocol/muc#admin'>
    <item affiliation='admin' jid='hecate@shakespeare.lit'/>
  </query>
</error>
```

Otherwise, the service MUST modify the admin list and then inform the owner of success:

Listing 214: Service Informs Owner of Success

```
<iq from='coven@chat.shakespeare.lit' id='admin4' to='cronel@shakespeare.lit/desktop' type='result'/>
```

The service MUST also send presence notifications related to any affiliation changes that result from modifying the admin list as previously described.

10.11 Destroying a Room

A room owner MUST be able to destroy a room, especially if the room is persistent. The workflow is as follows:

1. The room owner requests that the room be destroyed, specifying a reason and an alternate venue if desired.

2. The room removes all users from the room (including appropriate information about the alternate location and the reason for being removed) and destroys the room, even if it was defined as persistent.

Other than the foregoing, this document does not specify what (if anything) a MUC service implementation shall do as a result of a room destruction request. For example, if the room was defined as persistent, an implementation MAY choose to lock the room ID so that it cannot be re-used, redirect enter requests to the alternate venue, or invite the current participants to the new room; however, such behavior is OPTIONAL.
In order to destroy a room, the room owner MUST send an IQ set to the address of the room to be destroyed. The <iq/> stanza shall contain a <query/> element qualified by the 'http://jabber.org/protocol/muc#owner' namespace, which in turn shall contain a <destroy/> element. The address of the alternate venue MAY be provided as the value of the <destroy/> element's 'jid' attribute. A password for the alternate venue MAY be provided as the XML character data of a <password/> child element of the <destroy/> element. The reason for the room destruction MAY be provided as the XML character data of a <reason/> child element of the <destroy/> element.

The following examples illustrate the protocol elements to be sent and received:

Listing 215: Owner Submits Room Destruction Request

```xml
<iq from='crone1@shakespeare.lit/desktop'
    id='begone'
    to='heath@chat.shakespeare.lit'
    type='set'>
    <query xmlns='http://jabber.org/protocol/muc#owner'>
      <destroy jid='coven@chat.shakespeare.lit'>
        <reason>Macbeth doth come.</reason>
      </destroy>
    </query>
</iq>
```

The service is responsible for removing all the occupants. It SHOULD NOT broadcast presence stanzas of type "unavailable" from all occupants, instead sending only one presence stanza of type "unavailable" to each occupant so that the user knows he or she has been removed from the room. If extended presence information specifying the JID of an alternate location and the reason for the room destruction was provided by the room owner, the presence stanza MUST include that information.

Listing 216: Service Removes Each Occupant

```xml
<presence
    from='heath@chat.shakespeare.lit/firstwitch'
    to='crone1@shakespeare.lit/desktop'
    type='unavailable'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <item affiliation='none' role='none'/>
    <destroy jid='coven@chat.shakespeare.lit'>
      <reason>Macbeth doth come.</reason>
    </destroy>
  </x>
</presence>

<presence
    from='heath@chat.shakespeare.lit/secondwitch'
    to='wiccarocks@shakespeare.lit/laptop'
    type='unavailable'>
</presence>
```
type='unavailable'>
<x xmlns='http://jabber.org/protocol/muc#user'>
  <item affiliation='none' role='none'/>
  <destroy jid='coven@chat.shakespeare.lit'>
    <reason>Macbeth doth come.</reason>
  </destroy>
</x>
</presence>
<presence>
  <from>'heath@chat.shakespeare.lit/thirdwitch'</n>
  <to>'hag66@shakespeare.lit/pda'
  <item affiliation='none' role='none'/>
  <destroy jid='coven@chat.shakespeare.lit'>
    <reason>Macbeth doth come.</reason>
  </destroy>
</x>
</presence>

Listing 217: Service Informs Owner of Successful Destruction

<iq from='heath@chat.shakespeare.lit'
  id='begone'
  to='crone1@shakespeare.lit/desktop'
  type='result'/>

If the 'from' address received on a destroy request does not match the JID of a room owner, the service MUST return a <forbidden/> error to the sender:

Listing 218: Service Denies Destroy Request Submitted by Non-Owner

<iq from='heath@chat.shakespeare.lit'
  id='destroytest'
  to='wiccarocks@shakespeare.lit/laptop'
  type='error'>
  <query xmlns='http://jabber.org/protocol/muc#owner'>
    <destroy jid='coven@chat.shakespeare.lit'>
      <reason>Macbeth doth come.</reason>
    </destroy>
  </query>
  <error type='auth'>
    <forbidden xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
  </error>
</iq>
11 Error and Status Codes

11.1 Error Codes

The error codes associated with the 'http://jabber.org/protocol/muc#user' namespace are fairly straightforward, as summarized in the following table. For detailed information about mapping legacy error codes to XMPP-style error types and conditions, refer to Error Condition Mappings \(^{24}\); implementations SHOULD support both legacy and XMPP error handling.

<table>
<thead>
<tr>
<th>Code</th>
<th>Type</th>
<th>Element</th>
<th>Context</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>401</td>
<td>Error</td>
<td>Presence</td>
<td>Entering a room</td>
<td>Inform user that a password is required</td>
</tr>
<tr>
<td>403</td>
<td>Error</td>
<td>Presence</td>
<td>Entering a room</td>
<td>Inform user that he or she is banned from the room</td>
</tr>
<tr>
<td>404</td>
<td>Error</td>
<td>Presence</td>
<td>Entering a room</td>
<td>Inform user that the room does not exist</td>
</tr>
<tr>
<td>405</td>
<td>Error</td>
<td>Presence</td>
<td>Entering a room</td>
<td>Inform user that room creation is restricted</td>
</tr>
<tr>
<td>406</td>
<td>Error</td>
<td>Presence</td>
<td>Entering a room</td>
<td>Inform user that the reserved roomnick must be used</td>
</tr>
<tr>
<td>407</td>
<td>Error</td>
<td>Presence</td>
<td>Entering a room</td>
<td>Inform user that he or she is not on the member list</td>
</tr>
<tr>
<td>409</td>
<td>Error</td>
<td>Presence</td>
<td>Entering a room</td>
<td>Inform user that his or her desired room nickname is in use or registered by another user</td>
</tr>
<tr>
<td>503</td>
<td>Error</td>
<td>Presence</td>
<td>Entering a room</td>
<td>Inform user that the maximum number of users has been reached</td>
</tr>
</tbody>
</table>

This document does not stipulate text strings (i.e., values of the XMPP <text/> element) associated with the foregoing error conditions.

11.2 Status Codes

Multi-User Chat uses a <status/> element (specifically, the ‘code’ attribute of the <status/> element) to communicate information about a user’s status in a room. Over time, the number of status codes has grown quite large, and new status codes continue to be requested of the author. Therefore, these codes are now documented in a registry maintained by the XMPP Registrar. For details, refer to the Status Codes Registry section of this document.

Note: In general, MUC status codes tend to follow the “philosophy” of status codes that is implicit in RFC 2616 \(^{25}\) and RFC 1893 \(^{26}\) (1xx codes are informational, 2xx codes specify that it is fine to continue, 3xx codes specify redirects such as being kicked or banned, x3x codes refer to system status, x7x codes refer to security or policy matters, etc.).

Note: If the MUC protocol were being designed today, it would specify a more flexible, XML-friendly approach rather than hardcoded status numbers; however, at this point the pain of changing the status reporting system would be greater than the benefit of doing so, which is why the status code numbers remain in use. A future version of this document may define a more XMPP-like approach to status conditions, retaining the code numbers but supplementing them with more descriptive child elements as is done in RFC 3920.

12 Internationalization Considerations

As specified in RFC 3920, XMPP entities (including MUC rooms and MUC services) SHOULD respect the value of the ‘xml:lang’ attribute provided with any given stanza. However, simultaneous translation of groupchat messages is out of scope for this document.

The status and error codes defined herein enable a client implementation to present a localized interface; however, definition of the localized text strings for any given language community is out of scope for this document.

Although the labels for various data form fields are shown here in English, MUC clients SHOULD present localized text for these fields rather than the English text.

13 Security Considerations

13.1 User Authentication and Authorization

No room entrance authentication or authorization method more secure than cleartext passwords is defined or required by this document. However, the risks involved can mitigated by the use of channel encryption and strong authentication via TLS and SASL as described in RFC

---

13.2 End-to-End Encryption

No end-to-end message or session encryption method is specified herein. Users SHOULD NOT trust a service to keep secret any text sent through a room.

13.3 Privacy

Depending on room configuration, a room may publicly log all discussions held in the room. A service MUST warn the user that the room is publicly logged by returning a status code of "170" with the user’s initial presence, and the user’s client MUST so warn the user if the room discussion is logged (a user’s client SHOULD also query the room for its configuration prior to allowing the user to enter in order to "pre-discover" whether the room is logged). A client MUST also warn the user if the room’s configuration is subsequently modified to allow room logging (which the client will discover when the room sends status code 170). Note: In-room history is different from public room logging, and naturally a room cannot effectively prevent occupants from separately maintaining their own room logs, which may become public; users SHOULD exercise due caution and consider any room discussions to be effectively public.

13.4 Information Leaks

The "roominfo" data form used in extended service discovery can result in information leaks, e.g., the current discussion topic (via the "roominfo_subject" field). The same is true of service discovery items (disco#items) requests from outside the room (which could be used to discover the list of room occupants).

Implementations and deployments are advised to carefully consider the possibility that this information might be leaked, and to turn off information sharing by default for sensitive data.

13.5 Anonymity

Depending on room configuration, a room MAY expose each occupant’s real JID to other occupants (if the room is non-anonymous) and will almost certainly expose each occupant’s real JID to the room owners and administrators (if the room is not fully-anonymous). A service MUST warn the user that real JIDs are exposed in the room by returning a status code of "100" with the user’s initial presence, and the user’s client MUST so warn the user (a user’s client SHOULD also query the room for its configuration prior to allowing the user to enter in order to "pre-discover" whether real JIDs are exposed in the room). A client MUST also warn the user if the room’s configuration is subsequently modified from semi-anonymous or fully-anonymous to non-anonymous (which the client will discover when the room sends status code 172) and SHOULD warn the user if the room’s configuration is subsequently...
modified from fully-anonymous to semi-anonymous (which the client will discover when the room sends status code 173).

13.6 Denial of Service

Public MUC rooms can be subject to a number of attacks, most of which reduce to denial of service attacks. Such attacks include but are not limited to:

1. Stuffing the room with a large number of illegitimate occupants and therefore preventing legitimate users from joining the room.

2. Sending abusive messages and then leaving the room before a kick or ban can be applied; such abusive messages include but are not limited to large messages that prevent participants from following the conversation thread or room history, personal attacks on participants (especially room administrators and moderators), offensive text, and links to spam sites.

3. Making rapid and repeated presence changes.

4. Using long nicknames to route around lack of voice.

5. Abusing the room administrators or other room occupants.

6. Registering multiple nicknames across a service and therefore denying the use of those nicknames.

7. Mimicking another occupant’s roomnick (e.g., by adding a space at the end or substituting visually similar characters), then sending messages from that roomnick in an effort to confuse the occupants.

These attacks can be mitigated but not completely prevented through the liberal use of administrative actions such as banning, the presence of automated room bots with administrative privileges, implementation of intelligent content filtering, checking the IP addresses of connected users (not always possible in a distributed system), applying voice rules to presence as well as messaging, matching room nicks using more stringent rules than the Resourceprep profile of stringprep, etc. However, experience has shown that it is impossible to fully prevent attacks of this kind.

13.7 Other Considerations

See XEP-0203 for security considerations regarding the inclusion and processing of delayed delivery notations.
14 IANA Considerations

This document requires no interaction with the Internet Assigned Numbers Authority (IANA) 27.

15 XMPP Registrar Considerations

The XMPP Registrar 28 includes the following information in its registries.

15.1 Protocol Namespaces

The XMPP Registrar includes the following MUC-related namespaces in its registry of protocol namespaces:

- http://jabber.org/protocol/muc
- http://jabber.org/protocol/muc#admin
- http://jabber.org/protocol/muc#owner
- http://jabber.org/protocol/muc#user

15.2 Service Discovery Category/Type

A Multi-User Chat service or room is identified by the "conference" category and the "text" type within Service Discovery.

15.3 Service Discovery Features

There are many features related to a MUC service or room that can be discovered by means of Service Discovery. The most fundamental of these is the 'http://jabber.org/protocol/muc' namespace. In addition, a MUC room SHOULD provide information about the specific room features it implements, such as password protection and room moderation.

27The Internet Assigned Numbers Authority (IANA) is the central coordinator for the assignment of unique parameter values for Internet protocols, such as port numbers and URI schemes. For further information, see <http://www.iana.org/>.

28The XMPP Registrar maintains a list of reserved protocol namespaces as well as registries of parameters used in the context of XMPP extension protocols approved by the XMPP Standards Foundation. For further information, see <http://xmpp.org/registrar/>.

15.4 Well-Known Service Discovery Nodes

The well-known Service Discovery node 'http://jabber.org/protocol/muc#rooms' enables discovery of the rooms in which a user is an occupant. The well-known Service Discovery node 'x-roomuser-item' enables a user to discover his or her registered roomnick from outside the room. The well-known Service Discovery node 'http://jabber.org/protocol/muc#traffic' enables discovery of the namespaces that are allowed in traffic sent through a room (see the Allowable Traffic section of this document).
15.5 Field Standardization

Field Standardization for Data Forms 29 defines a process for standardizing the fields used within Data Forms qualified by a particular namespace. Within MUC, there are four uses of such forms: room registration (the "muc#register" FORM_TYPE), requesting voice and approving voice requests ("muc#request"), room configuration ("muc#roomconfig"), and service discovery extensions for room information ("muc#roominfo"). The reserved fields are defined below.

15.5.1 muc#register FORM_TYPE

```xml
<form_type>
  <name>http://jabber.org/protocol/muc#register</name>
  <desc>Forms enabling user registration with a Multi-User Chat (MUC) room or admin approval of user registration requests.</desc>
  <field>
    var='muc#register_allow'
    type='boolean'
    label='Allow this person to register with the room?'/>
  </field>
  <field>
    var='muc#register_email'
    type='text-single'
    label='Email Address'/>
  </field>
  <field>
    var='muc#register_faqentry'
    type='text-multi'
    label='FAQ Entry'/>
  </field>
  <field>
    var='muc#register_first'
    type='text-single'
    label='Given Name'/>
  </field>
  <field>
    var='muc#register_last'
    type='text-single'
    label='Family Name'/>
  </field>
  <field>
    var='muc#register_roomnick'
    type='text-single'
    label='Desired Nickname'/>
  </field>
  <field>
    var='muc#register_url'
    type='text-single'
</form_type>
```

128
15.5.2 muc#request FORM_TYPE

```xml
<form_type>
  <name>http://jabber.org/protocol/muc#request</name>
  <doc>XEP-0045</doc>
  <desc>
  Forms enabling voice requests in a Multi-User Chat (MUC) room or admin approval of such requests.
  </desc>

  label='----------of_a_group.'/>
<field>
  var='muc#roominfo_logs'
</form_type>
15.6 Status Codes Registry

15.6.1 Process

The XMPP Registrar maintains a registry of values for the 'code' attribute of the <status/> element when qualified by the 'http://jabber.org/protocol/muc#user' namespace. In order to submit new values to this registry, the registrant shall define an XML fragment of the following form and either include it in the relevant XMPP Extension Protocol or send it to the email address <registrar@xmpp.org>:

```
<statuscode>
  <number>the three-digit code number</number>
  <stanza>the stanza type of which it is a child (message or presence)</stanza>
  <context>the use case or situation in which the status is used</context>
  <purpose>a natural-language description of the meaning</purpose>
  <child>the descriptive child element (reserved for future use)</child>
</statuscode>
```

The registrant may register more than one status code at a time, each contained in a separate <statuscode/> element.

15.6.2 Initial Submission

As part of this document, the following status codes are registered:

```
<statuscode>
```
<number>100</number>
<stanza>message or presence</stanza>
<context>Entering a room</context>
<purpose>Inform user that any occupant is allowed to see the user's full JID</purpose>
</statuscode>

<statuscode>
___<number>101</number>
___<stanza>message(out_of_band)</stanza>
___<context>Affiliation_change</context>
___<purpose>Inform_user_that_his_or_her_affiliation_changed_while_not_in_the_room</purpose>
</statuscode>

<statuscode>
___<number>102</number>
___<stanza>message</stanza>

<statuscode>
  <number>301</number>
  <stanza>presence</stanza>
  <context>Removal from room</context>
  <purpose>Inform user that he or she has been banned from the room</purpose>
</statuscode>

<statuscode>
15.7 URI Query Types

As authorized by XMPP URI Query Components\(^\text{30}\), the XMPP Registrar maintains a registry of queries and key-value pairs for use in XMPP URIs (see [http://xmpp.org/registrar/querytypes.html](http://xmpp.org/registrar/querytypes.html)).

15.7.1 join

The "join" querytype is registered as a MUC-related action, with an optional key of "password".

\(^{30}\text{XEP-0147: XMPP URI Query Components \text{<http://xmpp.org/extensions/xep-0147.html>.}}\)
Listing 219: Join Action: IRI/URI

```
xmpp:coven@chat.shakespeare.lit?join
```

The application MUST either present an interface enabling the user to provide a room nickname or populate the room nickname based on configured preferences or nickname discovery.

Listing 220: Join Action: Resulting Stanza

```
<presence to='coven@chat.shakespeare.lit/thirdwitch'>
   <x xmlns='http://jabber.org/protocol/muc'/>
</presence>
```

The join action MAY include a password for the room. Naturally, access to a URI that includes a room password MUST be appropriately controlled.

Listing 221: Join Action with Password: IRI/URI

```
xmpp:coven@chat.shakespeare.lit?join;password=cauldronburn
```

Listing 222: Join Action with Password: Resulting Stanza

```
<presence to='coven@chat.shakespeare.lit/thirdwitch'>
   <x xmlns='http://jabber.org/protocol/muc'>
      <password>cauldronburn</password>
   </x>
</presence>
```

The following submission registers the "join" querytype.

```
<querytype>
   <name>join</name>
   <proto>http://jabber.org/protocol/muc</proto>
   <desc>enables joining a multi-user chat room</desc>
   <doc>XEP-0045</doc>
   <keys>
      <key>
         <name>password</name>
         <desc>the password required to enter a multi-user chat room</desc>
      </key>
   </keys>
</querytype>
```

15.7.2 invite

The "invite" querytype is registered as a MUC-related action, with an optional key of "jid".
Listing 223: Invite Action: IRI/URI

```
xmpp:coven@chat.shakespeare.lit?invite;jid=hecate@shakespeare.lit
```

If the joining user is not yet in the room, the application MUST send two stanzas: the first to join the room and the second to invite the other individual. If the joining user is in the room already, the application shall send only the invitation stanza.

Listing 224: Invite Action: Resulting Stanza(s)

```
<presence to='coven@chat.shakespeare.lit/thirdwitch'>
  <x xmlns='http://jabber.org/protocol/muc'/>
</presence>

<message to='coven@chat.shakespeare.lit'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <invite to='hecate@shakespeare.lit'/>
  </x>
</message>
```

The URI may include multiple invitees:

Listing 225: Invite Action With Multiple Invitees: IRI/URI

```
xmpp:coven@chat.shakespeare.lit?invite;jid=hecate@shakespeare.lit;jid=bard@shakespeare.lit
```

Listing 226: Invite Action With Multiple Invitees: Resulting Stanza

```
<message to='coven@chat.shakespeare.lit'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <invite to='hecate@shakespeare.lit'/>
    <invite to='bard@shakespeare.lit'/>
  </x>
</message>
```

The URI may also include a password:

Listing 227: Invite Action With Password: IRI/URI

```
xmpp:coven@chat.shakespeare.lit?invite;jid=hecate@shakespeare.lit;password=cauldronburn
```

If the joining user is not yet in the room, the application MUST send two stanzas: the first to join the room and the second to invite the other individual. If the joining user is in the room already, the application shall send only the invitation stanza.
Listing 228: Invite Action With Password: Resulting Stanza(s)

```
<presence to='coven@chat.shakespeare.lit/thirdwitch'>
  <x xmlns='http://jabber.org/protocol/muc'/>
</presence>

<message to='coven@chat.shakespeare.lit'>
  <x xmlns='http://jabber.org/protocol/muc#user'>
    <invite to='hecate@shakespeare.lit'/>
    <password>cauldronburn</password>
  </x>
</message>
```

The following submission registers the "invite" querytype.

```
<querytype>
  <name>invite</name>
  <proto>http://jabber.org/protocol/muc</proto>
  <desc enables simultaneously joining a groupchat room and inviting others</desc>
  <doc>XEP-0045</doc>
  <keys>
    <key>
      <name>jid</name>
      <desc>the Jabber ID of the invitee</desc>

```

16 Business Rules

16.1 Addresses

In order to provide consistency regarding the addresses captured in room JIDs, Room IDs MUST match the Nodeprep profile of Stringprep and Room Nicknames MUST match the Resourceprep profile of Stringprep (both of these are defined in RFC 3920). Although not explicitly stated in RFC 3920, both the Room ID (node) and Room Nickname (resource) portions of a Room JID MUST be of non-zero length. In addition, a MUC service MUST NOT allow empty or invisible Room Nicknames (i.e., Room Nicknames that consist only of one or more space characters).

It is up to the service implementation whether it will further restrict roomnicks (e.g., by
applying case folding routines, the Nodeprep profile of stringprep, or other restrictions).

16.2 Message

1. If an occupant wants to send a message to all other occupants, a MUC client MUST set the 'type' attribute to a value of "groupchat". A service MAY ignore messages that are improperly typed, or reject them with a <bad-request/> error.

2. If a MUC service receives a message directed to the room or to a single occupant from a user who has a role of "none", the service MUST NOT deliver the message and SHOULD return the message to the sender with a <forbidden/> error.

3. If a MUC service receives a message directed to a room that does not exist or is not yet unlocked, the service SHOULD return the message to the sender with an <item-not-found/> error.

4. A MUC service SHOULD pass extended information (e.g., an XHTML version of the message body) through to occupants unchanged; however, a MUC service MAY disallow message specific extensions (see the Allowable Traffic section of this document).

5. A MUC client MAY generate extensions that conform to the Message Events \(^{31}\) or Chat State Notifications \(^{32}\) specification; however, a MUC service MAY disallow these extensions (see the Allowable Traffic section of this document).

16.3 Presence

1. A room MUST silently ignore unavailable presence received from a user who has a role of "none".

2. Only the MUC service itself SHOULD generate extended presence information about roles, affiliations, full JIDs, or status codes qualified by the 'http://jabber.org/protocol/muc#user' namespace (based on information the service knows about occupants, e.g., roles, or as a result of actions taken by a moderator or room administrator). A client SHOULD NOT presume to generate such information. If a MUC service receives such extended presence information from an occupant, it MUST NOT reflect it to other occupants. (A client MAY generate extended presence information qualified by the 'http://jabber.org/protocol/muc#user' namespace in

order to supply a password, but naturally this is not reflected to other occupants.)

3. A MUC service SHOULD allow all other presence information to pass through, although it MAY choose to block extended presence information; see the Allowable Traffic section of this document.

4. In order to appropriately inform occupants of room roles and affiliations, and to make it easier for clients to track the current state of all users in the room, MUC service implementations MUST provide extended presence information about roles and affiliations in all presence stanzas, including presence stanzas of type "unavailable" sent when a user exits the room for any reason.

5. If a privilege is revoked, the service MUST note that by sending an <x/> element qualified by the 'http://jabber.org/protocol/muc#user' namespace and containing an <item/> child element with the 'role' and/or 'affiliation' attributes set to a value that indicates the loss of the relevant privilege. All future presence stanzas for the occupant MUST include the updated role and affiliation, until and unless they change again.

6. A MUC service MUST send extended presence to a client even if the client did not send an empty <x/> element qualified by the 'http://jabber.org/protocol/muc' namespace on entering the room; naturally, a client MUST ignore such information if it does not understand it (in accordance with RFC 3920).

7. Extended presence about roles and affiliations sent in the muc#user namespace MUST include the full JID (not the bare JID) as the value of the 'jid' attribute.

8. A client MAY send a custom exit message if desired (as is often done in IRC channels) by including a <status/> element in the presence stanza of type "unavailable" sent when exiting a room.

16.4 IQ

1. MUC is designed for sharing of messages and presence, not IQs. An IQ sent to the JID of the room itself is handled by the room and is not reflected to all of the room occupants.

2. If an occupant wants to send an IQ stanza to another user in a non-anonymous room, the sender SHOULD send the request directly to the recipient’s bare JID or full JID, rather than attempting to send the request through the room (i.e., via the recipient’s room JID).
3. If an occupant wants to send an IQ stanza to another user in a semi-anonymous room, the sender can direct the stanza to the recipient’s room JID and the service MAY forward the stanza to the recipient’s real JID. However, a MUC service MUST NOT reveal the sender’s real JID to the recipient at any time, nor reveal the recipient’s real JID to the sender.

4. A MUC client MUST send only the 'affiliation' attribute or the 'role' attribute in the <item/> element contained within an IQ set qualified by the 'http://jabber.org/protocol/muc#admin' namespace; if a moderator, admin, or owner attempts to modify both the affiliation and role of the same item in the same IQ set, the service MUST return a <bad-request/> error to the sender. However, a MUC service MAY modify a role based on a change to an affiliation and thus MAY send presence updates that include both a modified role and a modified affiliation.

5. In IQ sets regarding roles, a MUC client MUST include the 'nick' attribute only; in IQ results regarding roles, a MUC service MUST include the 'nick', 'role', 'affiliation', and 'jid' attributes (with the value of the latter set to the user's full JID).

6. In IQ sets regarding affiliations, a MUC client MUST include the 'jid' attribute only (with the value set to the bare JID); in IQ results regarding affiliations, a MUC service MUST NOT include the 'role' attribute, MUST include the 'affiliation' attribute and the 'jid' attribute (with the value set to the bare JID), and SHOULD include the 'nick' attribute (except if the affiliation is "outcast", since outcasts SHOULD NOT have reserved nicknames).

17 Implementation Notes
The following guidelines may assist client and component developers in creating MUC implementations.

17.1 Services
1. In handling messages sent by visitors in a moderated room, a MUC service MAY queue each message for approval by a moderator and MAY inform the sender that the message is being held for approval; however, such behavior is OPTIONAL, and definition of a message approval protocol (e.g., using Data Forms as defined in XEP-0004) is out of scope for this document.

2. It is common for MUC services to provide in-room messages when certain events occur, such as when the subject changes, when an occupant enters or exits, or when a room is
destroyed. Such messages are entirely OPTIONAL and are left up to the implementation or deployment, but if used MUST be messages of type "groupchat" sent from the room JID itself (<room@service>) rather than a specific occupant (<room@service/nick>). However, in general it is preferable for the receiving client to generate such messages based on events in the room (e.g., user entrances and exits) as well as specific status codes provided in MUC; this will help ensure correct localization of such messages.

3. Out of courtesy, a MUC service MAY send an out-of-room <message/> to an occupant who is kicked or banned, and MAY broadcast an in-room <message/> to all remaining occupants informing them that the occupant has been kicked or banned from the room. However, such messages are OPTIONAL, and indeed are unnecessary since the information required for a receiving client to generate such messages is communicated in the presence stanzas (specifically the status codes) sent by a MUC service.

4. Out of courtesy, a MUC service MAY send an out-of-room <message/> if a user’s affiliation changes while the user is not in the room; the message SHOULD be sent from the room to the user’s bare JID. MAY contain a <body/> element describing the affiliation change, and MUST contain a status code of 101.

5. There is no requirement that a MUC service shall provide special treatment for users of the older "groupchat 1.0" protocol, such as messages that contain equivalents to the extended presence information that is qualified by the 'http://jabber.org/protocol/muc#user' namespace.

6. Room types MAY be configured in any combination. A MUC service MAY support or allow any desired room types or combinations thereof.

7. A MUC service MAY limit the number of configuration options presented to an owner after initial configuration has been completed, e.g. because certain options cannot take effect without restarting the service.

8. A MUC service MAY provide an interface to room creation and configuration (e.g., in the form of a special XMPP entity or a Web page), so that the ostensible room owner is actually the application instead of a human user.

9. A MUC service MAY choose to make available a special in-room resource that provides an interface to administrative functionality (e.g., a "user" named "ChatBot"), which occupants could interact with directly, thus enabling admins to type '/command parameter' in a private message to that "user". Obviously this kind of implementation
would require the service to add a 'ChatBot' user to the room when it is created, and to prevent any occupant from having the nickname 'ChatBot' in the room. This might be difficult to ensure in some implementations or deployments. In any case, any such interface is OPTIONAL.

10. A MUC service SHOULD remove a user if the service receives a delivery-related error in relation to a stanza it has previously sent to the user; the delivery-related errors are <gone/>, <item-not-found/>, <recipient-unavailable/>, <redirect/>, <remote-server-not-found/>, and <remote-server-timeout/>.

11. A MUC service MAY choose to discard extended presence information that is attached to a <presence/> stanza before reflecting the presence change to the occupants of a room. That is, an implementation MAY choose to reflect only the <show/>, <status/>, and <priority/> child elements of the presence element as specified in the XML schema for the 'jabber:client' namespace, with the result that presence "changes" in extended namespaces (e.g., gabber:x:music:info) are not passed through to occupants. If a service prohibits certain extended namespaces, it SHOULD provide a description of allowable traffic at the well-known Service Discovery node 'http://jabber.org/protocol/muc#traffic' as described in the Allowable Traffic section of this document.

12. A MUC service MAY choose to discard extended information attached to <message/> stanzas before reflecting the message to the occupants of a room. An example of such extended information is the lightweight text markup specified by XHTML-IM 33. If a service prohibits certain extended namespaces, it SHOULD provide a description of allowable traffic at the well-known Service Discovery node 'http://jabber.org/protocol/muc#traffic' as described in the Allowable Traffic section of this document.

13. A MUC service MAY choose to "lock down" room nicknames (e.g., hardcoding the room nickname to the bare JID of the occupant). If so, the service MUST treat the locked down nickname as a reserved room nickname and MUST support the protocol specified in the Discovering Reserved Room Nickname section of this document.

17.1.1 Allowable Traffic

As noted, a service (more precisely, a properly-configured room) MAY discard some or all extended namespaces attached to <message/> and <presence/> stanzas that are intended for reflection from the sender through the room to all of the room occupants. If the room does so, it SHOULD enable senders to discover the list of allowable extensions by sending a disco#info

query to the well-known Service Discovery node 'http://jabber.org/protocol/muc#traffic', returning one <feature/> element for each namespace supported in the result. If the room does not allow any extended namespaces, it MUST return an empty query as specified in XEP-0030. If the room does not support the "#traffic" node, it MUST return a <feature-not-implemented/> error in response to queries sent to the 'http://jabber.org/protocol/muc#traffic' node.

The following example shows a room that allows the 'http://jabber.org/protocol/xhtml-im' and 'http://jabber.org/protocol/rosterx' namespaces only, but no other extended namespaces.

Listing 229: User Queries Service Regarding Allowable Namespaces

```xml
<iq from='wiccarocks@shakespeare.lit/laptop'
     to='heath@chat.shakespeare.lit'
     id='allow1'
     type='get'>
   <query xmlns='http://jabber.org/protocol/disco#info'
           node='http://jabber.org/protocol/muc#traffic'/>
</iq>
```

Listing 230: Service Returns Allowable Namespaces

```xml
<iq from='heath@chat.shakespeare.lit'
     to='wiccarocks@shakespeare.lit/laptop'
     id='allow1'
     type='result'>
   <query xmlns='http://jabber.org/protocol/disco#info'
           node='http://jabber.org/protocol/muc#traffic'>
     <feature var='http://jabber.org/protocol/xhtml-im'/>
     <feature var='http://jabber.org/protocol/rosterx'/>
   </query>
</iq>
```

If a service does not discard any namespaces or does not implement this feature, it MUST return a <service-unavailable/> error:

Listing 231: Service Returns Service Unavailable

```xml
<iq from='heath@chat.shakespeare.lit'
     to='wiccarocks@shakespeare.lit/laptop'
     id='allow1'
     type='error'>
   <query xmlns='http://jabber.org/protocol/disco#info'
           node='http://jabber.org/protocol/muc#traffic'/>
   <error type='cancel'>
     <service-unavailable xmlns='urn:ietf:params:xml:ns:xmpp-stanzas'/>
   </error>
</iq>
```
17.2 Clients

1. Clients MAY present room roles by showing ad-hoc groups for each role within a room roster. This will enable occupants to clearly visualize which occupants are moderators, participants, and visitors. However, such a representation is OPTIONAL.

2. Clients MAY implement a variety of interface styles that provide "shortcuts" to functionality such as changing one’s nickname, kicking or banning users, discovering an occupant’s full JID, or changing the subject. One option consists of IRC-style commands such as '/nick', '/kick', '/ban', and '/whois'; another is to enable a user to right-click items in a room roster. All such interface styles are OPTIONAL. However, for convenience, a mapping of IRC commands to MUC protocols is provided below.

17.2.1 IRC Command Mapping

Internet Relay Chat clients use a number of common "shortcut" commands that begin with a forward slash, such as '/nick' and '/ban'. The following table provides a mapping of IRC-style commands to MUC protocols, for use by clients that wish to support such functionality.
### Command | Function | MUC protocol
---|---|---
/ban <roomnick> [comment] | bans user with that roomnick from this room (client translates roomnick to bare JID) | `<iq id='someid' to='room@service' type='set'><query xmlns='http://jabber.org/protocol/muc#admin'><item affiliation='outcast' jid='bare-jid-of-user'><reason comment/></reason></item></query></iq>`
/invite <jid> [comment] | invites user with that JID to this room | `<message to='room@service''><x xmlns='http://jabber.org/protocol/muc#user'><invite to='jid'><reason comment/></reason></invite></x></message>`
/join <roomname> [pass] | joins room on this service (roomnick is same as nick in this room) | `<presence to='room@service/nick'><x xmlns='http://jabber.org/protocol/muc#user'><pass-word>pass</password></x></presence>`
/kick <roomnick> [comment] | kicks user with that roomnick from this room | `<iq id='someid' to='room@service' type='set'><query xmlns='http://jabber.org/protocol/muc#admin'><item nick='roomnick' role='none'><reason comment/></reason></item></query></iq>`
/msg <roomnick> <foo> | sends private message "foo" to roomnick | `<message to='room@service/nick' type='chat'><body>foo</body></message>`
/nick <newnick> | changes nick in this room to "newnick" | `<presence to='room@service/newnick'/>`
/part [comment] | exits this room (some IRC clients also support /leave) | `<presence to='room@service/nick' type='unavailable'><status-comment><status/></status-comment></presence>`
/topic <foo> | changes subject of this room to "foo" | `<message to='room@service' type='groupchat'><subject>foo</subject></message>`
Note: Because MUC roomnicks follow the Resourceprep profile of stringprep, they are allowed to contain a space character, whereas IRC nicknames do not. Although a given client MAY support quotation characters for this purpose (resulting in commands such as '/ban "king lear" insanity is no defense'), most common quotation characters (such as ' ' and '/') are also allowed by Resourceprep, thus leading to added complexity and potential problems with quotation of roomnicks that contain both spaces and quotation characters. Therefore it is NOT RECOMMENDED for XMPP clients to support IRC-style shortcut commands with roomnicks that contain space characters.

Note: Many XMPP clients also implement a '/me' command as described in The /me Command. This command does not result in any MUC or IRC protocol action and is therefore not shown in the foregoing table.

18 XML Schemas

18.1 http://jabber.org/protocol/muc

```xml
<?xml version='1.0' encoding='UTF-8'?>
