Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

- 1 Reinventing the wheel
- 2 Let's have an Argument
- 3 Closures
- 4 Call me maybe?

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

1 Reinventing the wheel

2 Let's have an Argument

3 Closures

4 Call me maybe?

Greeter

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 struct Greeter;  
2  
3 impl Greeter {  
4     fn call(...){  
5         println!("Hello Rust");  
6     }  
7 }
```

What is the most logical choice for
calls argument?

- A `self`
- B `&self`
- C `&mut self`
- D Nothing (not a method)

Greeter

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 struct Greeter;  
2  
3 impl Greeter {  
4     fn call(...){  
5         println!("Hello Rust");  
6     }  
7 }
```

What is the most logical choice for
calls argument?

- A self
- B &self
- C &mut self
- D Nothing (not a method)

Greeter

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1  struct Greeter;
2
3  impl Greeter {
4      fn call(&self) {
5          println!("Hello Rust");
6      }
7
8      fn call_mut(&mut self) {
9          self.call()
10     }
11
12     fn call_once(self) {
13         self.call()
14     }
15 }
```

- We can implement all variants
- `&mut self` can be re-borrowed as `&self`
- `self` can be borrowed as `&self`

More Useful Greeter

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1  struct Greeter(String);
2
3  impl Greeter {
4      fn call(&self) {
5          println!("Hello {}", self.0);
6      }
7
8      fn call_mut(&mut self) {
9          self.call()
10     }
11
12     fn call_once(self) {
13         self.call()
14     }
15 }
```

- What if we attach data to our `struct`?
- Makes no difference as long as we only use it by `&T` reference

Fibonacci

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 struct Fib(u64, u64);
2
3 impl Fib {
4     fn call(...) -> u64 {
5         let res = self.0;
6         self.0 = self.1;
7         self.1 += res;
8         res
9     }
10 }
```

What is the most logical choice
for `call`s argument?

- A `self`
- B `&self`
- C `&mut self`
- D Nothing (not a method)

Fibonacci

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1  struct Fib(u64, u64);
2
3  impl Fib {
4      fn call(...) -> u64 {
5          let res = self.0;
6          self.0 = self.1;
7          self.1 += res;
8          res
9      }
10 }
```

What is the most logical choice
for `call`s argument?

- A `self`
- B `&self`
- C `&mut self`
- D Nothing (not a method)

Fibonacci

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1  struct Fib(u64, u64);
2
3  impl Fib {
4      fn call_mut(&mut self) -> u64 {
5          let res = self.0;
6          self.0 = self.1;
7          self.1 += res;
8          res
9      }
10
11     fn call_once(mut self) -> u64 {
12         self.call_mut()
13     }
14 }
```

- Obviously can't do `&self` anymore
- `self` can be borrowed as `&mut self`

Nonce

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 struct Nonce(Vec<u8>);  
2  
3 impl Fib {  
4     fn call(...) -> Vec<u8> {  
5         self.0  
6     }  
7 }
```

What is the most logical choice
for `call`'s argument?

- A `self`
- B `&self`
- C `&mut self`
- D Nothing (not a method)

Nonce

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 struct Nonce(Vec<u8>);  
2  
3 impl Fib {  
4     fn call(...) -> Vec<u8> {  
5         self.0  
6     }  
7 }
```

What is the most logical choice
for `call`'s argument?

- A `self`
- B `&self`
- C `&mut self`
- D Nothing (not a method)

Nonce

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 struct Nonce(Vec<u8>);  
2  
3 impl Fib {  
4     fn call_once(self) -> Vec<u8> {  
5         self.0  
6     }  
7 }
```

- Has to take `self`
- Moves its inner value out once

Some Traits

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

We've seen there is no one size fits all solution. We can define some traits though:

```
1 trait FnOnce {
2     type Output;
3     fn call_once(self) -> Self::Output;
4 }
5
6 trait FnMut: FnOnce {
7     fn call_mut(&mut self) -> Self::Output;
8 }
9
10 trait Fn: FnMut {
11     fn call(&self) -> Self::Output;
12 }
```

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

1 Reinventing the wheel

2 Let's have an Argument

3 Closures

4 Call me maybe?

Arguments

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

- Aren't we missing something?
- With our current traits we can return any `Type`, but take no arguments
- We want to take an arbitrary number of parameters with varying types (variadic)
- Rust has no variadic generics

The Real Traits

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 trait FnOnce<Args> {
2     type Output;
3     extern "rust-call" fn call_once(self, args: Args) ->
4     ↪ Self::Output;
5 }
6 trait FnMut<Args>: FnOnce<Args> {
7     extern "rust-call" fn call_mut(&mut self, args: Args) ->
8     ↪ Self::Output;
9 }
10 trait Fn<Args>: FnMut<Args> {
11     extern "rust-call" fn call(&self, args: Args) -> Self::Output;
12 }
```

These traits are all **unstable** to implement.

The Catch

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

- We can't `impl` these traits ourselves
- Closures automatically implement them
- Functions automatically implement them
- We can't directly use these traits as bounds
- There is sugar for `Fn` trait bounds

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

1 Reinventing the wheel

2 Let's have an Argument

3 Closures

4 Call me maybe?

Greeter

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 let mut greeter =  
2   || println!("Hello Rust!");  
3  
4 greeter();  
5 greeter.call(());  
6 greeter.call_mut(());  
7 greeter.call_once(());
```

- Desugars to the same thing as our first example
- Except it implements the `Fn` traits
- All possible ones

More Useful Greeter

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 let name = "Cologne".to_string();
2 let mut greeter =
3   || println!("Hello {}!", name);
4
5 greeter();
6 greeter.call(());
7 greeter.call_mut(());
8 greeter.call_once(());
```

- This is the same as our second example.
- Or is it?

More Useful Greeter

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 fn greeter(  
2     name: String  
3 ) -> impl Fn() {  
4     || println!("Hello {}!", name)  
5 }  
6  
7 let mut greeter =  
8     greeter("Cologne".into());  
9  
10 greeter();  
11 greeter.call(());  
12 greeter.call_mut(());  
13 greeter.call_once(());
```

- closure may outlive the current function, but it borrows `name`, which is owned by the current function

- Wait... borrows?

More Useful Greeter

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1  struct Greeter {
2  __ name: &String
3  }
4
5  // Pseudocode!
6  impl Fn for Greeter {
7  __ fn call(&mut self) {
8  __     println!("Hello {}!", self.name);
9  __ }
10 }
```

- This is the actual desugaring
- Closures capture variables based on their usage
- Capturing means taking a reference, or storing (moving) the value

More Useful Greeter

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1  fn greeter(  
2    name: String  
3  ) -> impl Fn() {  
4    move || println!("Hello  
   ↪   {}!", name)  
5  }  
6  
7  let mut greeter =  
8    greeter("Cologne".into());  
9  
10 greeter();  
11 greeter.call(());  
12 greeter.call_mut(());  
13 greeter.call_once(());
```

- Actually desugars to our second example
- `move` enforces moving the values captured from the environment
- Closures can still contain references, in case the captured value is a reference

Fibonacci

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 let mut a = 1;
2 let mut b = 1;
3 let mut fib = move || {
4     let res = a;
5     a = b;
6     b += res;
7     res
8 };
9
10 fib();
11 // error: `Fn` is not implemented
12 // fib.call(());
13 fib.call_mut(());
14 fib.call_once(());
```

- Desugars to our Fibonacci example
- Implementing `Fn` is not possible, so the compiler doesn't

Nonce

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 let n = vec![4, 8, 15, 16, 23, 42];
2 let nonce = || n;
3
4 nonce();
5 // error: `Fn` is not implemented
6 // nonce.call(());
7 // error: `FnMut` is not implemented
8 // nonce.call_mut(());
9 // error: value has been moved ;)
10 nonce.call_once();
```

- Desugars to our Nonce example
- Implementing `Fn` and `FnMut` is not possible, so the compiler doesn't
- Behaves the same with and without `move`, closure has to move the value to return it

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

- 1 Reinventing the wheel
- 2 Let's have an Argument
- 3 Closures
- 4 Call me maybe?**

Fn Trait Bounds

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

- Can't use the unstable `Fn` traits as bounds directly
- But there is sugar that we can use
- And it conveniently looks like a function signature
 - `Fn(u32) -> u64`
 - `FnMut(&str) -> i32`
 - `FnOnce(u8) -> String`

Map One

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1  struct Abstraction<T> (T);
2
3  impl<T> Abstraction<T> {
4      fn map<U, F> (self, f: F) -> Abstraction<U>
5          where F: FnOnce (T) -> U
6      {
7          Abstraction (f (self.0))
8      }
9  }
```

While it may seem strange at first `FnOnce` is the most general trait bound. Everything can be called at least once.

Map Two

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 struct Abstraction2<T> (T, T);
2
3 impl<T> Abstraction2<T> {
4     fn map<U, F> (self, mut f: F) -> Abstraction2<U>
5         where F: FnMut (T) -> U
6     {
7         Abstraction2 (f (self.0), f (self.1))
8     }
9 }
```

When you need to call the function more than once `FnMut` is the next best option. Choosing `Fn` as a bound is rare as it gives the calling function almost no additional options.

Give me five

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 fn give5 () -> impl Fn () -> u64 {  
2   __ || 5  
3 }  
4  
5 let dave_brubeck = give5 ();  
6 assert_eq!(5, dave_brubeck ());
```

When returning a closure `Fn` is most general since it allows calling the object multiple times and behind any kind of reference.

Give me 5n

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

```
1 fn counter() -> impl FnMut() -> u64 {  
2     let mut n = 0;  
3     move || {  
4         n += 1;  
5         5 * n  
6     }  
7 }
```

Depending on the traits the closure can actually implement, we fall back to `FnMut` or `FnOnce`.

Fn Traits

Florob

Reinventing
the wheel

Let's have an
Argument

Closures

Call me
maybe?

Questions

Thank you for your attention.
Any questions?
